3.11. RANDOM COPOLYMERS

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(acetaldehyde-*co*-chloral)	Fractional precipitation	Chloroform/methanol		1457
Poly(acrolein-*co*-thiophenolmercaptal)				
	Fractional precipitation	Benzene/methanol		2911
Poly(acrylonitrile-*co*-α-hydroxyisobutyric acid anhydrosulfite)				
	Turbidimetric titration	Dimethylformamide/chloroform		1426
Poly(5-(1-adamantyloxy)-2H-pyrrole-2-one-*co*-methyl methacrylate)				
	Chromatography	Tetrahydrofuran	SEC, styragel	3484
Poly(5(1-adamantyloxy)-2H-pyrrole-2-one-*co*-styrene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	3484
Poly(*N*-alaninylmaleimide-*co*-methacrylic acid)				
	Chromatography	Dimethylformamide	SEC, μ-styragel, 40°C	1901
Poly(*N*-alaninylmaleimide-*co*-vinyl acetate)				
	Chromatography	Dimethylformamide	SEC, μ-styragel, 40°C	1901
Poly(di-*n*-alkylsiloxane-*co*-di-*n*-hexylsiloxane)				
	Chromatography	Toluene	SEC	2496
Poly(β-allyloxypropionaldehyde-*co*-acrylonitrile)				
	Chromatography	Tetrahydrofuran	SEC, styragel	137
Poly(β-allyloxypropionaldehyde-*co*-styrene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	137
Poly(butyleneglycol-*alt*-(terephthalic acid-sebacic acid))				
	Chromatography	*o*-Chlorophenol		2047
Poly(carbon monoxide-*co*-ethylene)				
	Chromatography	Trichlorobenzene	SEC, styragel, 135°C	1108
Poly(carbon monoxide-*co*-vinyl chloride)				
	Chromatography	Carbon tetrachloride–ethyl alcohol(1 : 1) tetrahydrofuran	TLC, gradient elution	1633
Poly(1,3-bis(p-carboxyphenoxy)propane-*co*-sebacic acid)				
	Chromatography	Chloroform	SEC, styragel	685
Poly(3,3-bis(chloromethyl)oxacyclobutane-*co*-β-propiolactone)				
	Chromatography	Chlorobenzene	SEC, styragel	3465
	Fractional precipitation	Ethylene dichloride/ethanol		3124
Poly(cyclohexane oxide-*co*-nitroethylene)				
	Extraction	Benzene		1429

References page VII-438

TABLE 3. *cont'd*

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(cyclohexene-*alt*-*N*-ethylmaleimide)				
	Chromatography	Ethanol/cyclohexane	Alternating, SEC *n*-octylporasil, 25°C	3486
Poly(cyclohexene carbonate-*co*-cyclohexene ether)				
	Chromatography	Tetrahydrofuran	SEC, ultrastyragel, 35°C	3101
Poly(diketene-*co*-tetrahydrofuran)				
	Extraction	Methanol, benzene		3123
Poly(epichlorohydrin-*co*-styrene)				
	Turbidimetric titration	Benzene/methanol		2177
Poly(ether ketone)s	Chromatography	Tetrahydrofuran	SEC, styragel	1792
Poly(diethylazocarboxylate-*alt*-*N*-vinylcarbazole)				
	Extraction	Acetone or carbon tetrachloride		3288
Poly(ethylene-*co*-e-caprolactone)				
	Chromatography	Tetrahydrofuran	SEC, Shodex	863
Poly(ethylene glycol-*co*-2,2-butyl-hydroxyphenyl)propane-*alt*-terephthalic acid)				
	Extraction	Boiling, ethyl ether, acetone, 1,2-dichloropropane, tetrahydrofuran, 1,2-dichloroethane		1201
Poly(etheylene terephthalate-*co*-caprolactone)				
	Fractional precipitation	Chloroform/methanol		3497
Poly(ferrocenylsilene-*co*-ferrocenylgermane)s				
	Chromatography	Tetrahydrofuran + 0.1 wt.% tetra-*n*-butylammonium bromide	SEC, ultrastyragel	2557
Poly(formaldehyde-*co*-dioxolane)				
	Fractional precipitation	Tetrachloroethane–phenol/cyclohexane		1433
Poly(1,6-hexamethylene diol-*co*-2-methyl-2-ethyl-1,3-propanediol-*alt*-sebacic acid)				
	Chromatography	Chloroform	SEC, styragel	2426
Poly(3-hydroxybutyrate-*co*-hydroxyvalerate)				
	Fractional precipitation	Chloroform/heptane		3567
Poly(3-hydroxybutyrate-*co*-3-hydroxypropianate)				
	Chromatography	Chloroform	SEC, styragel	2968
			SEC, ultrastyragel, 40°C	1826
	Fractional precipitation	Chloroform/*n*-heptane		508
Poly(3-hydroxybutyrate-*co*-4-hydroxypropianate)				
	Chromatography	Chloroform	SEC, ultrastyragel, 40°C	1826
Poly(3-hydroxybutyrate-*co*-3-hydroxyvalerate)				
	Fractional precipitation	Acetone/water		2204
Poly[(*N*-(4-hydroxyphenyl)maleimide)-*alt*-(*p*-trimethylsilyl-α-methylstyrene)]				
	Chromatography	Tetrahydrofuran	SEC, styragel, 40°C	575
Poly(D,L-lactic acid-*co*-glycolic acid)				
	Chromatography	Methylene chloride	SEC	2793
Poly(methyl-2-ethyl-2-thiirane-*co*-thiopropylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	2696
Poly(methyl methacrylate-*co*-*p*-cresyl methacrylate)				
	Fractional precipitation	Benzene/methanol	Crosslinked with *p*-cresol formaldehyde resins	2641
Poly(methyl methacrylate-*co*-dithio-3-chlorophenylene dithiophenylene methylenephenylene)				
	Extraction	Acetone and chloroform		1199
Poly(methyl methacrylate-*co*-oxyethylenedithioethylene)				
	Extraction	Acetone, carbon disulfide		1199
Poly(1,4-bis-(di-methylhydroxysilyl)phenylene-*co*-dimethylsiloxane)				
	Fractional precipitation	Benzene/methanol	20°C	98
Poly(methylphenyl phosphazene-*co*-methyl-3-amino phenyl phosphazene)				
	Chromatography	Tetrahydrofuran + 0.1% *n*-tetrabutylammonium bromide	SEC, μ-styragel, 30°C	3489
Poly(methylphenyl phosphazene-*co*-methyl-3-imino carbonyl ethylene)				
	Chromatography	Tetrahydrofuran + 0.1% *n*-tetrabutylammonium bromide	SEC, μ-styragel 30°C	3489
Poly(methylphenyl phosphazene-*co*-methyl-3-nitro phenyl phosphazene)				
	Chromatography	Tetrahydrofuran + 0.1% *n*-tetrabutylammonium bromide	SEC, μ-styragel, 25°C	3489
Poly(dimethylsilapropylene-*co*-diphenylsilapropynylenes)				
	Chromatography	Tetrahydrofuran	SEC, ultrastyragel	400

TABLE 3. *cont'd*

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(dimethylsilylene-*co*-diphenylsilylenes)				
	Fractional precipitation	Tetrahydrofuran/2-propanol		3590
Poly(dimethylsilylene-*co*-methyl-β-phenethylsilylene)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel	3590
	Fractional precipitation	Tetrahydrofuran/2-propanol		3590
Poly(dimethylsilylene-*co*-metylcyclohexylsilylene)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel	3590
	Fractional precipitation	Tetrahydrofuran/2-propanol		3590
Poly(dimethylsiloxane-*co*-isophorone diisocyanate)				
	Chromatography	Tetrahydrofuran	SEC, ultrastyragel, 40°C	3604
Poly(dimethylethylsilylene-*co*-phenylmethylsylylene)				
	Chromatography	Tetrahydrofuran	SEC, Shodex	145
Poly(octamethylcyclotetrasiloxane-*co*-octaphenylcyclotetrasiloxane)				
	Chromatography	Benzene	SEC, styragel	103
Poly(octaphenylcyclotetrasiloxane-*co*-octa methylcyclotetrasiloxane)				
	Chromatography	Benzene	SEC, styragel	101
Poly(dioxolane-*co*-tetrahydrofuran)				
	Fractional precipitation	Chloroform/*n*-hexane		3563
Poly(oxyethylene-*co*-oxypropylene)				
	Chromatography	Butanone, water saturated	TLC, silica gel	3329
		Dioxane–water (10 : 1)	TLC, silica gel	3329
		Hexane–butanone methanol (6 : 2 : 1)	TLC, silica gel	3329
	Turbidimetric titration	Dimethylformamide/water		1056
		Methanol/water		1056
Poly(phenyl methacrylate-*co*-methyl methacrylate)				
	Fractional precipitation	Benzene/methanol		995
Poly(*n*-propylmethylsilane-*co*-cyclohexylmethylsilane)				
	Chromatography	Chloroform	SEC, μ-styragel	2858
	Fractional precipitation	Toluene/ethyl acetate	25°C	2858
Poly(*n*-propylmethysilene-*co*-isopropylmethylsilane)				
	Chromatography	Chloroform	SEC, μ-styragel	2858
	Fractional precipitation	Toluene/ethyl acetate	25°C	2858
Poly(*n*-propylmethylsilene-*co*-phenylmethylsilene)				
	Chromatography	Chloroform	SEC, μ-styragel	2858
	Fractional precipitation	Toluene/ethyl acetate	25°C	2858
Poly(silarylene)-*alt*-poly(siloxane)s				
	Chromatography	Tetrahydrofuran	SEC, styragel, 25°C	809
Poly(styrene-*co*-ε-caprolactam)	Chromatography	Tetrahydrofuran	SEC	3533
			SEC, styragel	3532
	Extraction	Benzene and trifluoroethanol		1279
	Fractional precipitation	Benzene/methanol		3532,3533
Poly(styrene-*co*-oxyethylenedithioethylene)				
	Extraction	Cyclohexane and carbon disulfide		1199
Poly(tetrahydrofuran-*co*-1,2-butene oxide)				
	Chromatography	Tetrahydrofuran	SEC	1204
Poly(tetrahydrofuran-*co*-oxyproylene)				
	Chromatography	Tetrahydrofuran	SEC	346,347,349, 350,1204
Poly(tetrahydrofuran-*co*-*n*-propyl glycidyl ether)				
	Chromatography	Tetrahydrofuran	SEC	1204
Poly(tetrahydrofuran-*co*-vinyl butyl ether)				
	Extraction	*n*-Heptane, acetone		2644
Poly(dithiotetramethylene-*co*-methyl methacrylate)				
	Extraction	Acetone and carbon tetrachloride		1199
Poly(dithiotetramethylene-*co*-styrene)				
	Extraction	Cyclohexane and carbon disulfide		1199
Poly(3,3,3-trifluoropropylmethylsilane-*co*-methylpropylsilane)				
	Chromatography	Tetrahydrofuran	SEC	941
3.12. BLOCK COPOLYMERS				
Poly(acetaldehyde)-*block*-poly(oxypropylene)				
	Fractional solution	Methanol, chlorofom	Extraction	939

References page VII-438

TABLE 3. *cont'd*

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(5-(*p*-acrylamidophenyl)-10,15,20-triphenylporphin)-*block*-poly(styrene)				
	Chromatography	Benzene	SEC, bioglass	1223
Poly(acrylonitrile)-*block*-poly(butandiene)-*block*-epoxy resins				
	Turbidimetric titration	Chloroform/methanol		1579
Poly(acrylonitrile)-*block*-poly(oxyethylene)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel, 25°C	3110
Poly(acrylonitrile)-*block*-poly(oxymethylene)				
	Extraction	Acetonitrile		969
Poly(γ-benzyl-L-glutamate)-*block*-poly(butadiene)				
	Extraction	Ethyl acetate–methanol (85 : 15); dimethylformamide		2580
	Fractional precipitation	Chloroform–*n*-heptane (1 : 1)/ methanol		2580
		Chloroform/hexane		2345
Poly(γ-benzyl-D,L-glutamate)-*block*-poly(butadiene)-*block*-poly(γ-benzyl-D,L-glutamate)				
	Fractional precipitation	*n*-Hexane–chloroform/ethanol		1248
Poly(butadiene)-*block*-poly(ε-caprolactam)				
	Extraction	Tetramethylsilane, trifluoroethanol		1279
	Fractional precipitation	*m*-Cresol/cyclohexane		1279
Poly(butadiene)-*block*-poly(methyl-2-ethyl-2-thiirane)				
	Chromatography	Tetrahydrofuran	SEC, styragel	2696
Poly(butadiene)-*block*-poly(oxy-1,4-phenylenesulfonyl-1,4-phenylene-1,4-phenylene-isopropylidene-1,4-phenylene)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel	2653
Poly(butadiene)-*block*-poly(oxymethylene)				
	Extraction	Toluene, acetone, methanol, water		2414
Poly(butadiene-*co*-styrene)-*block*-(epoxy resins)				
	Turbidmetric titration	Chloroform/ethanol		1579
Poly(*n*-butyl isocyanate)-*block*-poly(styrene)				
	Chromatography	Falta disolvent	SEC	1082,1083
Poly(β-butyrolactone)-*block*-poly(oxyethylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	3550
Poly(β-butyrolactone)-*block*-poly(oxypropylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	3550
Poly(β-butyrolactone)-*block*-poly(propiolactone)				
	Chromatography	Tetrahydrofuran	SEC, styragel	3550
Poly(ε-caprolactam)-*block*-poly(1,4-butyleneglycol-*co*-4,4-diphenylmethanediisocyanate)				
	Fractional precipitation	Dimethylformamide/diamyl ether		2990
Poly(ε-caprolactam)-*block*-poly(isobutene)-*block*-poly(ε-caprolactam)				
	Extraction	*n*-Hexane, 2,2,2 trifluoroethanol		3494
Poly(ε-caprolactam)-*block*-poly(styrene)				
	Fractional precipitation	*m*-Cresol/cyclohexane		1279
	Turbidimetric titration	Toluene/*n*-hexane		1109
Poly(ε-caprolactone)-*block*-poly(lactide)				
	Extraction	Acetone, chloroform		881
Poly(ε-caprolactone)-*block*-poly(D,L-lactide)-*block*-poly(ε-caprolactone)				
	Chromatography	Dimethylformamide	SEC, styragel, 45°C	3036
Poly(ε-caprolactone)-*block*-poly(oxyethylene)				
	Fractional precipitation	Benzene–methanol/isooctane		2581,2582
		Benzene/isooctane		2581,2582
Poly(ε-caprolactone)-*block*-poly(β-propiolactone)				
	Fractional precipitation	Toluene/petroleum ether		1203
Poly(ε-caprolactone)-*block*-(tetrahydrofuran)-*block*-(ε-caprolactone)				
	Chromatography	Tetrahydrofuran	SEC	2412
Expoxide resin-*block*-poly(butadiene-*co*-styrene)				
	Turbidimetric titration	Chloroform/methanol		1580
Poly(ethylene glycol)-*block*-Poly(L-lysine)				
	Centrifugation	Tetrahydrofuran	SEC	1211
Poly(ethylene terepthalate)-*block*-poly(tetramethylene ether)				
	Cross fractional precipitation	Tetrachloroethane–methanol, trichloroethylene–*n*-heptane	20°C	3600
Poly(2,2-bis(4-hydroxyphenyl)propane-*block*-epxoy resin)				
	Chromatography	Tetrahydrofuran		686

TABLE 3. *cont'd*

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(2,2-bis(4-hydroxyphenyl)propane-*co*-bis(4-hydroxy-2,5-dichlorophenyl)methane-*co*-phosgene), (*block* copolymer)				
	Chromatography	Chloroform	SEC, styragel	2493
		Tetrahydrofuran	SEC, styragel	2493
Poly(isoprene)-*block*-poly(oxytetramethylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	1
Poly(isoprene)-*block*-(2,4-toluene diisocyanate)				
	Chromatography	Toluene, tetrahydrofuran	SEC	1082
Poly(D,L lactide)-*block*-poly(ethyleneglycol)				
	Chromatography	Tetrahydrofuran	SEC	739
Poly(methyl-2-ethyl-2-thiirane)-*block*-poly(propylene sulfide)				
	Chromatography	Tetrahydrofuran	SEC, styragel	2696
Poly(methyl glycidyl ether)-*block*-poly-(oxytetramethylene)				
	Fractional precipitation	Methanol/water		2645
Poly(methyl methacrylate)-*block*-poly-(oxytetramethylene)-*block*-poly(methylmethacrylate)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel, 25°C	3108
	Fractional precipitation	Choroform/methanol		3108
Poly(methyl methacrylate)-*block*-(2,4-toluenediisocyanate)				
	Chromatography	Toluene, tetrahydrofuran	SEC	1082
Poly(dimethyl siloxane)-*block*-poly(styrene)				
	Chromatography	Toluene	SEC, 20°C	701
Poly(dimethylsilylene)-*block*-poly(styrene)				
	Chromatography	Tetrahydrofuran	SEC	287,554
		Toluene	SEC, 20°C	701
Poly(dimethylsilylene)-*block*-poly(styrene)-*block*-poly(dimethylsilylene)				
	Chromatography	Toluene	SEC, μ-styragel, 25°C	178
			SEC, styragel	1511
Poly(α-methylstyrene)-*block*-poly-(oxytetramethylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	2747
Poly(α-methylstyrene)-*block*-poly(propylenesulfide)-*block*-poly(α-methylstyrene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	2747
Poly(1,3-dioxolane)-*block*-poly(p-methoxystyrene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	1410
Poly(oxybutylene)-*block*-poly(oxyethyylene)-*block*-poly(oxybutylene)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel	3542
Poly(oxycarbonyloxy-1,4-phenyleneisopropylidene-1,4-phenylene)-*alt*-poly(isobutene)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel	1929
Poly(oxydimethylsilylene)-*block*-poly(oxymethylsilylene)				
	Chromatography	Ethyl acetate	SEC, styragel, 30°C	93
Poly(oxyethylene)-*block*-poly(ethyl methacylate)				
	Fractional precipitation	Benzene/2,2,4-trimethylpentane		2951
Poly(oxyethylene)-*block*-poly(isoprene)-*block*-poly(ethylene oxide)				
	Sedimentation equilibrium	Water, chloroform	20°C	2271
	Sedimentation velocity	Water, chloroform	20°C	2271
Poly(oxyethylene)-*block*-poly(isoprene)-*block*-poly(styrene)-*block*-poly(isoprene)-*block*-poly(oxyethylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel, 30°C	1728
Poly(oxyethylene)-*block*-poly(methacrylonitrile)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel, 25°C	3110
Poly(oxyethylene)-*block*-poly(methyl methacrylate)-*block*-poly(oxyethylene)				
	Chromatography	Tetrahydrofuran	SEC	3109
Poly(oxyethlene)-*block*-poly(α-methylstyrene)				
	Chromatography	Tetrahydrofuran	SEC	1631
Poly(oxyethylene)-*block*-poly(oxybutylene)				
	Chromatography	Tetrahydrofuran	SEC, μ-styragel	3543
Poly(oxyethylene)-*block*-poly(oxyethylene)-*co*-bis(4-isocyanotophenyl)methane-*co*-poly(oxyethyleneoxyadipoyl)-*block*-poly(oxethylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel, 25°C	970
Poly(oxyethylene)-*block*-poly(oxyethyleneoxyadipoyl)				
	Fractional precipitation	Benzene/isooctane	35°C	970
Poly(oxyethylene)-*block*-poly(oxyethyleneoxyadipoyl)-1-methyl-2,4-disocyanato-benzene-poly(oxy-ethyleneoxyadipoyl-*block*-polyoxethylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel, 25°C	970
Poly(oxyethylene)-*block*-poly(oxypropylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	26
Poly(oxyethylene)-*block*-poly(oxypropylene)-*block*-poly(oxyethylene)				
	Chromatography	Dimethylformamide + lithium chloride	SEC, silica-Ti-fluoropolymer, 30°C	3424

References page VII-438

TABLE 3. *cont'd*

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(oxyethylene)-*block*-poly(isoprene)-poly(styrene)-*block*-poly(styrene)-*block*-poly(oxyethylene)				
	Chromatography	Tetrahydrofuran	SEC, styragel, 30°C	1728
Poly(oxyethylene)-*block*-poly(2-vinylpyridine)				
	Chromatography	Dimethylformamide	SEC, styragel	2039
	Fractional precipitation	Benzene/trimethyl-2,2, 4-pentane(isooctane)	35°C	2039
Poly(oxyethyleneoxyadipoyl)-*block*-poly(styrene)-*block*-poly(methyl methacrylate)				
	Fractional precipitation	Tetrahydrofuran/water		1253
Poly(oxymethylene)-*block*-poly(isoprene)				
	Extraction	Toluene, acetone, methanol water		2414
Poly(oxymethylene)-*block*-poly(2-methyl-5-vinylpyiidine)				
	Extraction water	Toluene, acetone, methanol,		2414
Poly(oxymethylene)-*block*-poly(α-methylstyrene)				
	Extraction	Toluene, acetone, methanol		2414
Poly(oxymethylene)-*block*-poly(styrene)				
	Extraction	Toluene, acetone, methanol,water		2414
Poly(oxypropylene)-*block*-poly(oxyethylene)-*block*-poly(oxypropylene)

		Tetrahydrofuran	Star polymer	3246
Poly(styrene)-*block*-poly(oxypropylene)				
	Chromatography	Dimethylformamide	SEC, Merck gel	3415
Poly(styrene)-*block*-poly(oxytetramethylene)				
	Chromatography	Dimethylformamide	SEC, Merck gel	3415
		Tetrahydrofuran	SEC, styragel	1,2746,3530
Poly(styrene)-*block*-(2,4-toluene diisocyanate)				
	Chromatography	Toluene, tetrahydrofuran	SEC	1082,1083
Poly(tetrahydrofuran)-*block*-(ε-caprolactone)				
	Chromatography	Tetrahydrofuran	SEC	2411
Poly[γ-(vinyloxy)ethyl cinnamate]-*block*-poly(isobutyl vinyl ether)				
	Chromatography	Ethyl acetate	SEC, styragel	1938

3.13. GRAFT COPOLYMERS

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(acrylic acid)-*graft*-poly(β-alanine)				
	Turbidimetric titration	Formic acid–water (85 : 15)/ethanol		1173
Poly(acrylonitrile)-*graft*-poly(imino-1,3-phenyleneiminoisophthaioyl)				
	Extraction	Dimethylformamide		1587
		Nitromethane/water (5%)		1587
	Fractional precipitation	Dimethylformamide/methanol		1587
Poly(acrylonitrile)-*graft*-poly(iminoadipoyliminohexamethylene)				
	Extraction	Dimethylformamide		1587
Poly(epoxide)-*graft*-poly(organosiloxanes)				
	Turbidimetric titration	Dioxane/water		96
Poly(α-hydroxyisobutyric acid anhydrosulfite)-*graft*-poly(acrylonitrile)				
	Turbidimetric titration	Dimethylformamide/chloroform		1426
Poly(bis(4-isopropylphenoxy)phosphazene)-*graft*-poly(styrene)				
	Fractional precipitation	Benzene/acetone		1067
Poly(methyl methacrylate)-*graft*-poly(imino-1-oxohexamethylene)				
	Extraction	Benzene or acetone		1259
Poly(methyl methacrylate)-*graft*-poly(iminoadipoyliminohexamethylene)				
	Fractional precipitation	Formic acid/methanol		1350
		m-Cresol/methanol		1350

TABLE 3. *cont'd*

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Poly(methyl methacrylate)-*graft*-poly(oxy-1-oxo-hexamethylene)				
	Extraction	Benzene		2301
Poly(dimethylsiloxane)-*graft*-poly(methyl methacrylate)				
	Extraction	Dimethylsulfoxide/tetrachlororethane		2630,3077
	Fractional demixing	Dimethyl sulfoxide/ tetrachloroethane		3077
Poly(2-methyl-2-oxazoline)-*graft*-poly(vinyl chloride)				
	Extraction	Methanol		3236
Poly(oxyethylene)-*graft*-poly(*n*-butyl methacrylate)				
	Fractional solution	Benzene/2,2,4-trimethylpentane	Column extraction	3200
Poly(oxyethylene)-*graft*-poly(iminoadipoyliminohexamethylene)				
	Extraction	Methanol		1586
Poly(oxyethylene)-*graft*-poly(methyl methacrylate)				
	Extraction	Ethylacetate, methanol		420
	Fractional precipitation	Chloroform/ethyl ether		3297
Poly(oxyethylene)-*graft*-poly(*n*-propylmethacrylate)				
	Fractional solution	Benzene/2,2,4-trimethylpentane	Column extraction	3200
Poly(oxyethyleneoxycarbonylimino-1,4-phenylenemethyleneiminocarbonyl)-*graft*-poly(acrylonitrile)				
	Extraction	Dimethylformamide/ethanol		14
Poly(oxyethyleneoxyterephthaloyl)-*graft*-poly(vinyl acetate)				
	Extraction	Acetone		870
Poly(oxyethyleneoxyterephthaloyl)-*graft*-poly(oxyethyleneoxysuccinoyl)				
	Chromatography	*o-tert*-Butylphenol	SEC, styragel, 110°C	2792
Poly(oxymethyleneoxyethylene)-*graft*-poly(*p*-methoxystyrene)				
	Chromatography	Tetrahydrofuran	SEC, styragel	1410
Poly(phenyl methyl silylene)-*graft*-poly(tetrahydrofuran)

Cotton-*graft*-poly(acrylamide)	Extraction	Water		3414
Cotton-*graft*-poly(glycidyl methacrylate)				
	Extraction	Butanone		3414
Cotton-*graft*-poly(methacrylic acid)				
	Extraction	Water		3414
Dextran-*graft*-poly(acrylamide)	Chromatography	Water (0.5M potassium phthalate)	SEC	2112,3505
Dextran-*graft*-poly(acrylamide-*co*-sodium-2-acrylamido-2-methyl propane sulfonate)				
	Chromatography	Water 0.4M Sodium sulfate	SEC, porous glass	2113
Dextran-*graft*-poly(methyl methacrylate)				
	Extraction	Several solvents		2467
Dextran-*graft*-poly-(*N*-vinylpyrrolidone)				
	Turbidimetric titration	Water/acetone		2962
Ethyl cellulose-*graft*-poly(acrylamide)				
	Extraction	Hot methanol		1008
Ethyl cellulose-*graft*-poly(methyl methacrylate)				
	Fractional precipitation	Acetone/methanol		530
Methyl cellulose-*graft*-poly(acrylonitrile)				
	Extraction	Water	Hot	530
Methylated xylan-*graft*-poly(styrene)				
	Fractional precipitation	Benzene/petroleum ether		2425
Oxycellulose-*graft*-poly(methyl methacrylate)				
	Extraction	Benzene		1041
		Xanthation process		1041
Starch-*graft*-poly(acrylamide)	Extraction	Etahn, 1,2-diol and acetic acid		3003
Starcg-*graft*-poly(acrylonitrile)	Chromatography	Dimethylformamide	SEC, 75°C	1141
	Extraction	Dimethylformamide		1142
		Dimethylformamide, γ butyrolactone, dimethysulfoxide		865
Starch-*graft*-poly(methyl methacrylate)				
	Extraction	Acetone		2190
	Extraction;precipitation	Benzene; Aq. dimethylfomamide/ methanol		530
Starch-*graft*-poly(styrene)	Chromatography	Tetrahydrofuran		1273
Starch-*graft*-poly(vinyl acetate)	Extraction	Water at 100°C;benzene		2194
Tricarbanilated (cellulose)-*graft*-poly(styrene)				
	Fractional precipitation	Dioxane/water		2917
4.3. MIXTURES OF POLYMERS				
Cellulose acetate + poly(oxyethylene)				
	Fractional precipitation	Dimethylformamide/ethyl ether		209

TABLE 4. *cont'd*

Polymer	Method of fractionation	Solvent or solvent/nonsolvent mixture	Remarks	Refs.
Cellulose acetate-*graft*-poly(vinyl acetate)				
	Extraction;precipitation	Methanol; benzene/methanol		509
Cellulose acetate-*graft*-poly(3-vinylpyridine)				
	Extraction	Methanol;acetone–dichloroethane (1:4)		3158
Cellulose acetate-*graft*-poly-(*N*-vinylpyrrolidone)				
	Extraction	Water, acetone		3159
Cotton-*graft*-poly(acrylamide)	Extraction	Water		3414
Cotton-*graft*-poly(glycidyl methacrylate)				
	Extraction	Butanone		3414
Cotton-*graft*-poly(methacrylic acid)				
	Extraction	Water		3414
Dextran-*graft*-poly(acrylamide)	Chromatography	Water (0.5M potassium phthalate)	SEC	2112,3505
Dextran-*graft*-poly(acrylamide-*co*-sodium-2-acrylamido-2-methyl propane sulfonate)				
	Chromatography	Water 0.4M Sodium sulfate	SEC, porous glass	2113
Dextran-*graft*-poly(methyl methacrylate)				
	Extraction	Several solvents		2467
Dextran-*graft*-poly-(*N*-vinylpyrrolidone)				
	Turbidimetric titration	Water/acetone		2962
Ethyl cellulose-*graft*-poly(acrylamide)				
	Extraction	Hot methanol		1008
Ethyl cellulose-*graft*-poly(methyl methacrylate)				
	Fractional precipitation	Acetone/methanol		530
Methyl cellulose-*graft*-poly(acrylonitrile)				
	Extraction	Water	Hot	530
Methylated xylan-*graft*-poly(styrene)				
	Fractional precipitation	Benzene/petroleum ether		2425
Oxycellulose-*graft*-poly(methyl methacrylate)				
	Extraction	Benzene		1041
		Xanthation process		1041
Starch-*graft*-poly(acrylamide)	Extraction	Etahn, 1,2-diol and acetic acid		3003
Starcg-*graft*-poly(acrylonitrile)	Chromatography	Dimethylformamide	SEC, 75°C	1141
	Extraction	Dimethylformamide		1142
		Dimethylformamide, γ butyrolactone, dimethysulfoxide		865
Starch-*graft*-poly(methyl methacrylate)				
	Extraction	Acetone		2190
	Extraction;precipitation	Benzene; Aq. dimethylfomamide/ methanol		530
Starch-*graft*-poly(styrene)	Chromatography	Tetrahydrofuran		1273
Starch-*graft*-poly(vinyl acetate)	Extraction	Water at 100°C;benzene		2194

A. INTRODUCTION

The tables contain qualitative solubility data for a selected number of polymers. Since no standard definition for solvent–nonsolvent systems has been used in most of the original sources, the recognition of a certain compound as a solvent or nonsolvent is to some extent influenced by personal interpretation. No attempt has been made to edit the original information. Division into only two classes, solvents and nonsolvents, is dictated by the practical point of view. For more quantitative information, the user is referred to the tables of theta solvents and fractionation of polymers in this Handbook.

The arrangement of polymers into classes is based on chemical structure. Since properties change gradually within a series of homologs, polymers are arranged according to increasing complexity, as regards the size of the monomer unit, and the kind and number of substituents. Only when this principle could not be applied was an alphabetical listing chosen. We believe that a typical solution behavior of similar polymers may be recognized more easily by this arrangement. When formulas are given, they refer to the main structures present in the polymers.

Polymers are named in a manner thought to be most recognizable to the reader. IUPAC or common names (and sometimes both) are used.

The table has nearly doubled in size since the last edition. New polymer categories include copolymers, main-chain carbonyl polymers, block copolymers and dendrimers, emphasizing recently developed materials. Copolymers are generally named with the dominant monomer given first, but the reader should check alternate names, since each polymer is listed only once. Solubility of copolymers generally resemble more or less the properties of the dominating monomer, although they often exhibit higher solubilities than the corresponding homopolymers. The solubility of block copolymers may reflect the solubilizing/dispersing power of one of the polymer segments rather than true solubility of all segments. Dendrimers are shown as the repeating monomer unit, with the terminal unit specified when known.

Solubility normally increases with rising temperature. However, negative temperature coefficients in some solvents are observed. This is particularly true for cellulose and poly(ethylene oxide)s.

Increasing molecular weight generally reduces solubility.

Increased branching increases the solubility compared to a linear polymer of the same molecular weight.

Certain combinations of two or more solvents may become nonsolvents. Conversely, mixtures of two or more nonsolvents may sometimes become solvents. These possibilities should be considered if new solvent–nonsolvent combinations are to be examined. It is recommended that the reader consults the solubility parameter section in this Handbook.

The classification of a certain compound as a nonsolvent does not necessarily imply its ability to act as a precipitant since this is also influenced by the nature of the particular solvent of a solvent–nonsolvent pair. However, most nonsolvents combine both properties.

The list of solvents and nonsolvents for each polymer is arranged alphabetically. If class names are used, they refer to the most common compounds. Less common compounds, although falling into a class already mentioned, are additionally cited.

Water is a nonsolvent for most polymers and is, therefore, often not mentioned or only mentioned if similar polymers or derivatives are water soluble.

The data refer to room temperature unless otherwise stated.

Homologs and closely related compounds generally have similar solubility properties. When specific solvents or nonsolvents are cited, it is done so with the understanding that homologs and compounds with similar structures can be expected to exhibit similar properties.

B. ABBREVIATIONS

bzn.	Benzene
DMA	*N,N*-Dimethylacetamide
DMF	*N,N*-Dimethylformamide
DMSO	Dimethyl sulfoxide
HMPT	Hexamethylphosphoric triamide
TMS	Tetramethylene sulfone
THF	Tetrahydrofuran
W	Water
aqu.	Aqueous
conc.	Concentrated
DS	Degree of substitution
degrad.	Degradation
dil.	Diluted
mol. wt.	Molecular weight
rt	Room temperature
SC	Substituent content
sw	Swelling
temp.	Temperature

C. TABLES OF SOLVENTS AND NONSOLVENTS

TABLE 1. MAIN-CHAIN ACYCLIC CARBON POLYMERS

Polymer	Solvents	Nonsolvents	Refs.
1.1. POLY(DIENES), POLY(ACETYLENES) (see also 6.1, 6.2)			
Poly(dienes) unsubstituted			
Poly(allene)	Bzn., halogenated hydrocarbons	Hexane, methanol	1
Poly(1,2-butadiene)	Toluene		2
57% 1,2-	Chloroform		3
Poly(1,3-butadiene)	Higher aliphatic ethers, hydrocarbons, higher ketones, THF	Alcohol, dil. acids, dil. alkalies, hypochlorite solutions, lower ketones and esters, nitromethane, propionitrile, W	4–6
98% *cis*-, 2% 1,2-	Bzn., toluene		7
95% *cis*-, 1% *trans*-	Cyclohexane		7
100% *cis*-	Bzn., heptane/hexane (1/1)		7
97% *trans*-, 3% 1,2-	Cyclohexane, toluene		7
Poly(isoprene),	See Poly(1,3-butadiene)		
cis-, with chlorosulfonylisocyanato groups	Toluene	Diethyl ether, hexane	8
Poly(dienes) substituted			
Poly(2-*tert*-butyl-1,3-butadiene)	Bzn., carbon disulfide, carbon tetrachloride, chloroform, diethyl ether, heptane	Acetone, alcohol	9,10
Poly(dicyclopentadiene)	Toluene	Methanol	11
Poly(5,7-dimethyl-1,6-octadiene)	See Poly(2-*tert*-butyl-1,3-butadiene)		
Poly(1-methoxybutadiene), crystalline		Acetone, bzn., dioxane, heptane, methanol	12
Poly(2-chlorobutadiene), chloroprene	Bzn., carbon tetrachloride, chlorinated hydrocarbons, cyclohexane/toluene, cyclohexanone, dioxane, ethyl acetate, pyridine	Alcohols, aliphatic hydrocarbons, hydrogen fluoride, ketones, mineral oils, nonoxidizing conc. acids incl. hydrogen fluoride, toluene (sw), W	4–7,13
1,4-*cis*-	Bzn., chloroform, ether, hexane, THF	Acetone, ethanol, methanol	14
Poly[2-(chloromethyl)butadiene]	Dichloromethane, THF, toluene	Ethanol, methanol	686
Poly(perfluoro-1,4-pentadiene)	Hexafluorobenzene		
Poly(2,5-diheptyl-1,4-phenylenehexa-1,3,5-triene-1,6-diyl)	Acetone, bzn., chloroform		16
Poly(1,5-pentamethyl-2-enediyl)	Methylene chloride	Methanol	17
Poly(butadiene-*co*-styrene) (7 : 3–95 : 5) Buna-S GR-S SBR rubber	Bzn., cyclohexane, toluene		7
Poly(acetylenes)			
Poly(acetylene)	Aniline, DMF, isopropylamine	Acetone, bzn., carbon tetrachloride, cyclohexane, methanol, methylene chloride, pyridine	18
Poly(phenylacetylene)			
low mol. wt.	Acetone, carbon tetrachloride, methanol		19,20
high mol. wt.	Bzn., cyclohexane (hot), toluene	Methanol	19–21
Poly(diphenyldiacetylene), poly-(1,4-diphenyl-1,3-butadiene), 	Chloroform, cyclohexane, dioxane	Methanol	22
Poly[bis(alkylthio)acetylene]	Aromatic hydrocarbons, halogenated hydrocarbons		23
Poly[3-(*tert*-butoxycarbonylmethyleneiminocarbonyloxy)-8-(5-pyrimidyl)-oct-5-yn-7-ene-1,8-diyl]	Chloroform, hexane, THF		24
Poly[2-(dodecyloxycarbonyl)-1,4-phenyleneethynylene]	THF (hot)	Methanol	25
Poly(9,9-dipropargylfluorene), 	Dichlorobenzene		26
Poly(1-propynyleneoxy-1,4-phenyleneisopropylidene-1,4-phenyleneoxy-2-propynylene)	DMF/pyridine	W	27,247
Poly(ethynylene-1,4-phenyleneoxy-1,4-phenyleneethynylene)	Dioxane, pyridine	Methanol	28
Poly(butadiene-*co*-acrylonitrile)	Acetone, bzn., chloroform		7

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
1.2. POLY(ALKENES)			
Poly(methylene)	See Polyethylene		
Polyethylene			
high density	Above 80°C: 1,2,4-trichlorobenzene, decalin, di-*n*-amyl ether, halogenated hydrocarbons, higher aliphatic esters and ketones, hydrocarbons, xylene	All common organic solvents at room temperature, more polar organic solvents even at elevated temperatures, inorganic solvents	4–7,13, 29,30
low density	As above, but temperature 20–30°C lower, depending on degree of branching	As above	5,7
chlorinated, 40% Cl	At elevated temperature: chlorobenzene, cyclohexanone, tetrachloroethane, tetrahydronaphthalene, toluene, xylene	Acetone, butanol, chloroform, dioxane, MEK, methanol, methyl acetate, THF	31
chlorinated, 60% Cl	At elevated temperature: acetone/carbon disulfide (1/1), aromatic hydrocarbons, chloroform, cyclohexane, THF	Acetone, aliphatic and cycloaliphatic hydrocarbons, ethanol, methanol, methyl acetate	31
chlorosulfonated, 30% Cl, 1.5% S	Chlorinated hydrocarbons, MEK, THF, toluene		32,33
Poly(ethylene *g*-maleic anhydride) (97 : 3)	Toluene, xylene	W	34
Poly(ethylene-*co*-propylene) (3 : 2)	Bzn., xylene (hot)		32
Poly(ethylene-*co*-acrylic acid) (6 : 1)	Xylene		32
Poly(vinyl chloride-*co*-ethylene) (1 : 9)	Cyclohexanone (hot), nitrobenzene/chloroform (1/1)		127
Poly(ethylene-*co*-propylene-*co*-5-methylene-2-norbornene) (40 : 55 : 5), PolyEPDM	1,2,4-Trichlorobenzene		32
Poly(propylene)			5,7
atactic	Bzn., chlorinated hydrocarbons at rt., cyclohexane, diethyl ether, ethylcyclohexane, hydrocarbons, isoamyl acetate, toluene	More polar organic solvents with small hydrocarbon group even at elevated temperature	
isotactic	See Polyethylene		
Poly(1-butene)			7,32
atactic	Bzn., chloroform, decalin, ethylcyclohexane, toluene		
isotactic	See Polyethylene, ethylcyclohexane		7
Poly(isobutene)	Aliphatic ethers, anisole, carbon disulfide, chlorinated hydrocarbons, di(2-chloroethyl) ether, diethylsulfide, higher alcohols, higher esters, hydrocarbons, THF	Lower alcohols, lower ketones and esters, nitromethane, lower organic acids, propionitrile	5,6,13, 30,35
Poly(4-methyl-1-pentene), isotactic	See Polyethylene		
Poly(2-methyl-3-hydroxy-1,4-butylene)	THF		36
Poly(1-hexene)	Chloroform, THF		37
Poly(cyclopentylethylene)	Chloroform, diethyl ether, toluene	Methanol	38
Poly(cyclohexylethylene)			
atactic	Chlorinated hydrocarbons, hydrocarbons, THF	Alcohols, ethers, dioxane, esters, ketones	39
stereospecific	At elevated temperature: bzn., chlorobenzene, decahydronaphthalene, *o*-dichlorobenzene, methylcyclohexane, tetrahydronaphthalene, xylene	Heptane, MEK, nitrobenzene	40
Poly(cyclohexylalkenes)	Chloroform, diethyl ether (partially), toluene	Methanol	41
Poly(cyclohexenylethylene)			
atactic	Aliphatic hydrocarbons	Acetone, ethanol	42
isotactic	Aromatic hydrocarbons, halogenated hydrocarbons (partially)	Acetone, aliphatic hydrocarbons, diethyl ether, ethanol	42
Poly(pentenamer), Poly(cyclopentene) $-\!\!\!\left[CH{=}CH(CH_2)_3\right]\!\!\!-$	Chlorinated hydrocarbons, hydrocarbons	Alcohols, aliphatic ketones, ethers	43
Poly(3,4-dicarboxypent-1-ene-1,5-diyl)	Chloroform, methanol	Diethyl ether	44

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Poly(3,4-dihydroxypent-1-ene-1,5-diyl)	DMSO, methanol	Ethanol	44
Poly(1,1-diphenyl-2-vinylcyclopropane)	Chloroform	Methanol	45
Poly(*p*-anthrylphenylethylene)	Bzn., chlorobenzene, methylene chloride	Methanol, ethanol, hexane, W	46
Poly(1-methylbicyclo-[2.2.1]-hept-2-ene)	Chlorobenzene, *p*-xylene	Methanol	47
Poly(vinylborazine)	Bzn.	Pentane	48
Poly(methylene-*alt*-5-hydroxycyclohexene-1,3-diyl)	Hexanes		49
Poly(ethylene-*co*-1,4-hexadiene) (97 : 3)	Toluene		50
Poly(ethylene-*co*-1-cyano-1,4-butylene) (1 : 2)	Acetone (hot), chloroform, DMA, DMSO	Methanol	51
Poly(isobutylene-*co*-4-methylstyrene) (95 : 5)	Chloroform		52
Poly[hexene-*co*-*N*,*N*-di(isopropyl)amino-1-pentene] (2 : 3)	Hexane		53
1.3. POLY(ACRYLICS), POLY(METHACRYLICS)			
1.3.1. POLY(ACRYLIC ACIDS)			
Poly(acrylic acid)			
atactic	Alcohols, dil. alkali solutions, formamide, DMF, W	Dioxane (hot) (sw), esters, hydrocarbons, ketones	4–6, 13,54
isotactic	Dioxane/water (80/20)	Dioxane	55
Poly(methacrylic acid)			
atactic	Alcohols, aqu. hydrogen chloride (0.002 M, >30°C), dil. aqu. sodium hydroxide, W	Carboxylic acids, esters, hydrocarbons, ketones	4,5
isotactic, syndiotactic	W(partially)		56
Poly(acrylic acid-*co*-9-vinylphenanthrene) (3 : 2)	THF		57
Poly(itaconic acid)	DMF, methanol, W	Acetone, aniline, bzn., carbon disulfide, chloroform, ethanol, ethyl acetate, THF	58
1.3.2. POLY(ACRYLATES)			
General	Aromatic hydrocarbons, chlorinated hydrocarbons, esters, ketones, THF	Aliphatic hydrocarbons, hydrogenated naphthalenes, diethyl ether	
Poly(methyl acrylate)	See General, acetone, bzn., ethyl acetate, glycol ester ethers, phosphorus trichloride	Alcohols, carbon tetrachloride	5,7, 30,59
Poly(ethyl acrylate)	See General, acetone, butanol, bzn., glycol ether, methanol, THF, *p*-xylene	Aliphatic alcohols C>4, cyclohexanol, tetrahydrofurfuryl alcohol	5,7, 30,59
Poly(2-hydroxyethyl acrylate)	Methanol, W		32
Poly(*n*-butyl acrylate)	See General, butanol, turpentine	Cyclohexyl acetate, ethanol, ethyl acetate, methanol	30
Poly(*tert*-butyl acrylate)	Acetone, methanol		7
Poly(4-hydroxybutyl acrylate)	Isopropanol		32
Poly(isobornyl acrylate)	THF		60
Poly(cyclohexyl acrylate)	Bzn., THF, toluene		32
Poly(2-ethylhexyl acrylate)	Esters, ketones, THF, toluene		32
Poly(benzyl acrylate)	Bzn., THF, toluene		32
Poly(5-cyano-3-thiapentyl acrylate)	Acetone, acetonitrile, dioxane, pyridine	Solvents of low solubility parameter	61
Poly[1-(*N*-ethyl-*N*-(1,4,7,10,13-penta-oxacyclopentadecyl)carbamoyl)ethylene]	Bzn., chloroform	Hexane	62
Poly(pentachlorophenyl acrylate)	Bzn., THF	Hexane, methanol, W	63
Poly(4–10,15,20-triphenylporphorin-21H,23H-5-ylphenyl acrylate)	Bzn., chloroform, THF, trifluoroacetic acid	Acetone, ethanol, hexane, methanol, W	64
Poly(vinylcyclohexane-*co*-methyl acrylate) (9 : 1)	THF	W	65
1.3.3. POLY(METHACRYLATES)			
General	Acetic acid, acetone, bzn., chlorobenzene, chloroform, cyclohexanol (hot), cyclohexanone, cyclohexyl acetate, dioxane, 2-ethoxyethanol, ethyl acetate, isobutanol (hot), isobutyric acid, MEK, methylene chloride, xylene	Castor oil, cyclohexane, diethyl ether, ethylene glycol, formamide, gasoline, glycerol, hexane, methanol, nujol	

References page VII - 536

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Poly(methyl methacrylate)			
atactic	See General, ethanol/water, ethanol/carbon tetrachloride, isopropanol/MEK (1/1) above 25°C, formic acid, nitroethane	Butylene glycol, carbon tetrachloride, *m*-cresol, diethyl ether, ethanol (absolute), higher esters, hydrogenated naphthalenes, linseed oil, turpentine	4,5,13, 30,66,67
isotactic	Acetone, acetonitrile, bzn., MEK, THF		7,32
syndiotactic	See isotactic		32
Poly(methyl methacrylate-*co*-2-acrylamido-2-methyl-1-propanesulfonic acid) (95 : 5)	Bzn., toluene		A32
Poly(ethyl methacrylate)	See General, carbon tetrachloride, ethanol (hot), ethyl ether, ethyl acetate, formic acid, isopropanol above 37°C, tetralin, turpentine (hot)	Alcohols, cyclohexane	5,7,67,68
Poly(2-hydroxyethyl methacrylate)	DMF, methanol, methyl Cellosolve®		32
Poly(*n*-propyl methacrylate)	See General, carbon tetrachloride, castor oil (hot), cyclohexane (hot), diethyl ether, ethanol, gasoline (hot), linseed oil (hot), turpentine	Formic acid	67
Poly(*n*-butyl methacrylate) and Poly(isobutyl methacrylate)	See General, carbon tetrachloride, castor oil (hot), cyclohexane, diethyl ether, ethanol (hot), gasoline, hexane, isopropanol above 23.7°C, linseed oil (hot), nujol (hot), turpentine	Ethanol (cold), formic acid	5,13,30, 67–69
Poly(butyl methacrylate-*co*-*i*-butyl methacrylate) (1 : 1)	Acetone, MEK, methylene chloride, THF, toluene		32
Poly(*n*-hexyl methacrylate)	Isopropanol above 33°C, MEK		5
Poly(cyclohexyl methacrylate)	Bzn., dioxane, THF		32
Poly(cyclohexylmethyl methacrylate)	Bzn., THF	Methanol	70
Poly(*n*-octyl methacrylate)	*n*-Butanol, MEK		5
Poly(2-ethylhexyl methacrylate)	Bzn., MEK, THF		32
Poly(*n*-decyl methacrylate)	Bzn., THF		32
Poly(*n*-lauryl methacrylate)	*n*-Pentanol above 29°C, isopropyl acetate, MEK	Ethyl acetate, methanol	5,71
Poly(phenyl methacrylate)	Bzn., MEK, THF, toluene		32
Poly(benzyl methacrylate)	Bzn., chloroform, dioxane, THF		32
Poly(4-*tert*-butylphenyl methacrylate)	Acetone		5
Poly[(4-(*tert*-butyoxycarbonyloxy)phenyl) methacrylate]	Bzn.		696
Poly(bornyl methacrylate)	Bzn.	Methanol	72
Poly(isobornyl methacrylate)	Bzn., THF, toluene		32
Poly[2-(dimethylamino)ethyl methacrylate]	Bzn., toluene		32
Poly[(2-trimethylsiloxy)ethyl methacrylate]	THF		73
Poly[2-(*N*-carbazoyl)ethyl methacrylate], crystalline	Aniline (hot, partially), diphenyl ether (hot), nitrobenzene (hot)	MEK	74
Poly(cyanomethyl methacrylate)	Acetone, acetonitrile, ethyl acetate, THF	Bzn., chloroform, methanol	75
Poly[2-(4-phenylazophenyl)ethyl methacrylate]	THF	Methanol	76
Poly[(methacryloyloxyundecyloxycarbonyldecyl)-2-(trimethylamino)ethyl phosphate]	Ethanol (hot), methanol	Acetone, bzn.	77
Poly[4-(4-methoxyphenyloxycarbonyl) phenoxyhexamethylene methacrylate]	Chloroform, THF, bzn., methylene chloride, *o*-dichlorobenzene,	Hexane, methanol	78
Poly[2-(dimethylamino)ethyl methacrylate-*co*-acrylamide] (4 : 1 to 2 : 3)	W		79
1.3.4. POLY(DISUBSTITUTED ESTERS)			
Poly(dimethyl itaconate)	Acetone, acetonitrile, bzn., DME, furfurol, halogenated hydrocarbons, methyl acetate, nitrobenzene, nitromethane, THF	Aliphatic hydrocarbons, carbon tetrachloride, diisopropyl ether, ethanol, ethyl acetate, methanol, propylene carbonate, toluene, W	80–82
Poly(di-*n*-butyl itaconate)	Acetone, amyl acetate, dioxane, ethanol, halogenated hydrocarbons, hydrocarbons, methyl acetate, THF	Acetonitrile, DMF, furfurol, methanol, nitrobenzene, nitromethane, propylene carbonate	81,82
Poly(diphenyl itaconate)	Bzn., chloroform, dioxane, DMF, ethyl acetate, THF		83

TABLE 1. *cont'd*

1.3.5. POLY(ACRYLAMIDES), POLY(METHACRYLAMIDES)			
Polyacrylamide	Ethylene glycol (partially), morpholine, W	Alcohols, diethyl ether, DMF, esters, higher glycols, hydrocarbons, nitrobenzene, propylene glycol, THF	4,5,13
Poly(*N*-isopropylacrylamide)	W (cold)	W (hot)	86,87
Poly(*N*,*N*-dimethylacrylamide)	Methanol, W (40°C)	W (sw)	5
Poly(*N*,*N*-diethylacrylamide)	THF		88
Poly[*N*-(1,1-dimethyl-3-oxobutyl) acrylamide]	Butanol, MEK, toluene	W (sw)	89
Poly(2-acrylamido-2-methyl-1-propanesulfonic acid), PolyAMPS	W		32
Poly(*N*-*tert*-butyl-*N*-allylacrylamide)	Chloroform	Petroleum ether	90
Poly(*N*-dodecylacrylamide-*co*-*N*-vinylcarbazole) (15 : 1 to 2 : 1)	Chloroform	Acrylonitrile	91
Polymethacrylamide	Acetone, ethylene glycol, methanol, W	Diethyl ether, hydrocarbons	4,5,13
Poly(*N*-carbazolylcarbonylethylene), Poly(9-acryloylcarbazole)			
atactic	Bzn. (partially)	Methanol	92
tactic	Chloroform (partially), conc. or moderately conc. sulfuric acid		5
Poly(morpholinocarbonylethylene), Poly(*N*-acryloylmorpholine)	DMF		5
Poly(piperidinocarbonylethylene), Poly(acryloylpiperidide)	DMF		5
1.4. POLY(VINYL ETHERS)			
General	Bzn., *n*-butanol, cyclohexanone, halogenated hydrocarbons, MEK	Heptane	
Unsubstituted			
Poly(methoxyethylene), Poly(methyl vinyl ether)			
amorphous	See General, acetone, ethanol, ethyl acetate, methylene chloride, THF, W (cold)	Diethyl ether, ethylene glycol, hexane, W (hot)	4,5,13,30,93–95
crystalline		Acetone, methanol, W	95,96
Poly(ethoxyethylene), Poly(ethyl vinyl ether),	See Poly(methoxyethylene)		
Poly(propoxyethylene), crystalline Poly(propyl vinyl ether)		Acetone, heptane	95
Poly(isopropoxyethylene), crystalline, Poly(isopropyl vinyl ether)	See Poly(propoxyethylene)		
Poly(butoxyethylene), Poly(butyl vinyl ether)	See General, bis(2-ethoxyethyl) ether, cyclohexane, diethyl ether, *n*-heptane	Ethanol, 2-ethoxyethanol	95,97
Poly(isobutoxyethylene), Poly(isobutyl vinyl ether)			
amorphous	See General, aliphatic alcohols C > 2, bis(2-ethoxyethyl) ether, carbon disulfide, cyclohexane, diethyl ether, *n*-heptane, isopropyl acetate, MEK, methylene chloride	Ethanol 2-ethoxyethanol, methanol	4,13,30, 93,98,99
crystalline	Chloroform above 50°C	Heptane, bis(2-ethoxyethyl) ether, bzn. (sw at 20°C), chloroform (sw at 20°C), isopropanol (hot), MEK	95
Poly(*tert*-butoxyethylene), Poly(*tert*-butyl vinyl ether)			
amorphous	Acetone, MEK		95,98
crystalline		Bzn., heptane	95,98
Poly(neopentyloxyethylene), Poly(neopentyl vinyl ether), crystalline		Bzn., heptane	95
Poly(cyclohexyloxyethylene), Poly(cyclohexyl vinyl ether)	Methylene chloride		100
Poly(benzyloxyethylene), Poly(benzyl vinyl ether) atactic	Acetone, bzn., toluene	Ethanol, methanol, W	101

References page VII - 536

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Substituted			
Poly(carbomethoxymethoxyethylene)	Chloroform, methylene chloride	Diethyl ether	102
Poly[2-(methoxyethoxy)ethylene], crystalline	W	Diethyl ether	95
Poly[2-(chloroethoxy)ethylene], crystalline		Acetone	95
Poly(2,2,2-trifluoroethoxyethylene), crystalline	Bzn., dioxane, heptane		95
Poly(methyl vinyl ether-*alt*-methyl tricyanoethylenecarboxylate)	DMA, DMF, nitromethane	Diethyl ether	103
Poly(phenyl vinyl ether-*alt*-2-phenyl-1,1-dicyanoethylene)	Acetone, carbon tetrachloride, chloroform, DMF, DMSO, THF	Hexane methanol	104
1.5. POLY(VINYL ALCOHOLS), POLY(ACETALS), POLY(VINYL KETONES)			
Poly(vinyl alcohol)			
atactic	Acetamide, DMF, DMSO (hot), formamide, glycerol (hot), glycols (hot), HMTP, piperazine, triethylenediamine, W	Carboxylic acids, chlorinated hydrocarbons, esters, hydrocarbons, ketones, lower alcohols, conc. aqu. salt solutions, THF	4–6,13, 30,105
syndiotactic	1,3-Propandiol above 160°C, W above 160°C		106
12% acetyl	W (cold)	Carboxylic acids, esters, halogenated hydrocarbons, hydrocarbons, ketones, W (hot)	4
35% acetyl	Alcohols, aqu. sol. of tetraalkyl-ammonium bromide and iodide	W	38
Poly(vinyl alcohol-*co*-ethylene) (1 : 1)	DMF (hot), DMSO (hot)	Methylene chloride, THF	107
Poly(vinyl alcohol-*co*-maleic anhydride) (1 : 1)	Acetone		108
Poly(allyl alcohol)			
lower mol. wt.	Cresol, dioxane, glycerol, methanol, pyridine, THF		13
high mol. wt. (DP>350)	Mixtures of conc. hydrochloric acid and dioxane, methanol, THF	Most organic solvents, W	13
Poly(vinyl formal)	Acetic acid, benzyl alcohol, bzn./alcohol (70/30), carbon tetrachloride/alcohol (70/30), 2-chloroethanol, chloroform, cyclohexanone, dichloroethylene/ diacetone alcohol (50/50), dioxane, DMF, furfurol, THF, toluene	Acetone (sw), aliphatic hydrocarbons, aromatic hydrocarbons (sw), dilute acids, dioxane, esters, ethanol, methanol, pyridine (sw), W	4,6,30
Poly(vinyl acetal)	Acetone, benzyl acetate, bzn./ethanol (1/1), bzn., butanol, carbon tetrachloride, 2-chloroethanol, chloroform, chloroform/methanol (9/1), cyclohexanone, dioxane, ethanol, ethyl acetate, ethylene glycol, THF	Dil. acids, aliphatic hydrocarbons, diethyl ether (sw), pyridine (sw), W	6,30
high degree of acetalization	Acetic acid (glacial), dioxane, ethanol, ethylene dichloride, methanol, nitromethane, pyridine	Acetone, bzn.	4
Poly(vinyl butyral)			
acetalization 70%	Alcohols, cyclohexanone, ethyl glycol acetate, ethyl lactate	Aliphatic ketones, hydrocarbons, methylene chloride, most esters, W	109
acetalization 77%	Acetone, alcohols, cyclohexanone, lower esters, methylene chloride	Higher esters, hydrocarbons, methyl isobutyl ketone	109
acetalization 83%	Alcohols, lower esters, ketones, methylene chloride	Higher esters, hydrocarbons, methanol	109
Poly(vinyl alcohol-*co*-vinyl pentanal)	Bzn., chloroform	Methanol	110
Poly(2-vinyl-4,7-dihydro-1,3-dioxepine), 	Acetone, 2-buten-1,2-diol	W	111
Poly(vinyl cyclohexanone ketal), 	Butanol, chloroform, cyclohexanone, ethanol, ethylene glycol, ethylene chloride, THF	Aliphatic hydrocarbons, carbon tetrachloride (sw), diethyl ether (sw)	30

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Poly(vinyl methyl ketone)	Acetic acid, acetone, chloroform, dioxane, DMF, ethyl acetate, pyridine, THF	Alcohol, carbon tetrachloride, diethyl ether, petroleum ether, W	4,6,13
Poly(methyl isopropenyl ketone)	Acetone, dioxane, esters	Alcohol, petroleum ether, W	6,13
1.6. POLY(VINYL HALIDES)			
Poly(vinyl chloride)			
high mol. wt.	Acetone/carbon disulfide, chlorobenzene, cyclohexanone, cyclopentanone, DMF, DMSO, MEK, nitrobenzene, THF	Acetic anhydride (sw), acetone (sw), nonoxidizing acids, alcohols, conc. alkalies, aniline (sw), carbon disulfide, carboxylic acids, esters, hydrocarbons, nitroparaffins (sw), vinyl chloride	4–7,13, 30,112
lower mol. wt.	Acetone/carbon disulfide, cyclohexanone, 1,2-dichlorobenzene, diisopropyl ketone, dioxane, DMF, ethylene chloride, HMPT, isophorone, mesityl oxide, nitrobenzene, perchloroethylene/acetone, toluene, tricresyl phosphate		4–6,13,30
chlorinated, 63% Cl	Acetone, aromatic hydrocarbons, butyl acetate, chlorobenzene, chloroform, cyclohexanone, dioxane, DMF, DMSO, nitrobenzene, THF	Aliphatic and cycloaliphatic hydrocarbons, carbon tetrachloride, methyl acetate, nitromethane, organic and inorganic acids	6
Poly(vinylidene chloride)	Benzonitrile, butyl acetate, cyclohexanone, 1,2-dichlorobenzene, dioxane, DMA, DMF, NMP, tetrahydrofurfuryl alcohol, tetralin (hot), THF (hot), trichloroethane	Conc. and moderately conc. acids and alkalies (except ammonia), alcohols, carbon disulfide, chloroform, cyclohexanone (cold, sw), dioxane (cold, sw), ethyl bromide, hydrocarbons, phenols, THF (cold, sw)	4,6,30, 113,114
Poly(vinyl bromide)	Cyclohexanone, THF	DMF, ethanol, HMPT, hydrocarbons, methanol	5
Poly(vinyl fluoride)	Cyclohexanone (hot), dinitrile, DMA (hot), DMF, DMSO (hot)	Aliphatic, cycloaliphatic, and aromatic hydrocarbons	115
chlorinated, 30% Cl	DMF	Aliphatic, cycloaliphatic, and aromatic hydrocarbons	115
chlorinated, 60% Cl	Carbon tetrachloride	Aliphatic, cycloaliphatic, and aromatic hydrocarbons	115
Poly(vinylidene fluoride)	γ-Butyrolactone, cyclohexanone, DMA, DMF, DMSO, ethylene carbonate, NMP	Acetone, alcohols, aliphatic and cycloaliphatic hydrocarbons, chlorinated solvents, methyl isobutyl ketone	116–119
Poly(1,2-difluoroethylene)	Acetone, DMF, methyl isobutyl ketone	Ethanol, hydrocarbons, methanol	118
Poly(1-chloro-1-fluoroethylene)	Toluene		120
Poly(chlorotrifluoroethylene)	2,5-Dinitrotrifluorobenzene (130°C), bzn. (200°C), carbon tetrachloride (114°C), cyclohexane (235°C), 1,2-dichlorotrifluorobenzene, HMPT, mesitylene (140°C), toluene (142°C), 1,1,1-trichloroethane (120°C), 1,2,3-trifluoropentachloropentane	Common organic solvents at RT	4,5,13, 121,674
Poly(tetrafluoroethylene)	Perfluorokerosene (350°C), no other solvent known		4,13,122,123
Poly(3,3,3-trifluoropropylene)	Acetone, hexafluorobenzene	Ethanol, hydrocarbons, methanol	124
Poly(hexafluoropropylene)	Hexafluorobenzene, perfluorodibutylamine, perfluorodibutyl ether		125
Poly(3,3,4,4,5,5,5-heptafluoro-1-pentene)	Perfluorohexane		126
Poly(vinylidene chloride cyanide-*alt*-1,3-cyclohexadiene)	Chloroform	Pentane	128
Poly(chlorotrifluoroethylene-*co*-vinylidene fluoride) (3 : 1)	MEK	Amyl acetate	129
Poly(tetrafluoroethylene-*co*-hexafluoropropylene) (4 : 1)	Carbon dioxide (>200°C)		130
Poly[tetrafluoroethylene-*co*-4,5-difluoro-2,2-bis(trifluoromethyl)-1,3-dioxole] (13 : 87 and 35 : 65)	Hexafluorobenzene, perfluorooctane		131

References page VII - 536

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
1.7. POLY(VINYL NITRILES)			
Polyacrylonitrile	Acetic anhydride, γ-butyrolactone, ε-caprolactam, bis(2-cyanoethyl)ether, bis(4-cyanobutyl)sulfone, chloroacetonitrile/water, chloroacetonitrile, cyanoacetic acid, dimethyl phosphite, dimethyl sulfone, dioxanone, DMA, DMF, DMSO, ethylene carbonate, *N*-formylhexamethyleneimine, 2-hydroxyethyl methyl sulfone, *N*-methyl-β-cyanoethylformamide, methylene dithiocyanate, *N*-methyl-α,α,α,-trifluoroacetamide, 1-methyl-2-pyridone, 3-,4-nitrophenol, nitromethane/W (94 : 6), *N*-nitrosopiperidine, 2-oxazolidone, 1,3,3,5-tetracyanopentane, tetramethylene sulfoxide, 1,1,1-trichloro-3-nitro-2-propane, sulfuric acid, nitric acid, *p*-phenol sulfonic acid, conc. aqu. sodium thiocyanate, molten quat. ammonium salts and their aqu. solutions	Acetonitrile (sw), acrylonitrile, alcohols, aliphatic nitro compounds, bis(2-hydroxyethyl) sulfoxide, chlorinated hydrocarbons, 3,4-dimethyl sulfolane, diethyl ether, diethyl sulfone (sw), diethyl sulfoxide, diethylformamide, dimethylmalonitrile, dimethyloxamide, 1,1-dimethylsuccinonitrile, ethylene urea, formamide, hexamethylene dithiocyanate, 1,6-hexanediamine, hydrocarbons, 1-hydroxypropionitrile, ketones, methanol, methoxyacetamide, methoxyacetonitrile, methyl thiocyanate, 1-nitrophenol, propyl formate	5,6,13,132, 133,675
ultrahigh MW	DMF (100°C)		134
Poly(2-fluoroacrylonitrile)	DMF	THF	135
Poly(acrylonitrile-*co*-vinyl acetate) (98 : 2)	DMF		136
Poly(acrylonitrile-*alt*-1,3-isoprene)	1,2-Dichloroethane	Methanol	137
Poly(vinylidine fluoride-*co*-ethyl vinyl ether) (1 : 1)	THF		135
Poly(acrylonitrile-*co*-butadiene) (2 : 3 to 1 : 4)	MEK, THF (partially), toluene		32
Polymethacrylonitrile	Acetic anhydride, acetone, benzonitrile, cyanoacetic acid, cyclohexanone, dinitriles, DMF (>20°C), DMSO, ethylene carbonate, furfural, HMPT, methylene chloride, nitromethane, pyridine	Aliphatic hydrocarbons, alcohols, esters, methacrylonitrile, toluene	4,5
1.8. POLY(VINYL ESTERS)			
Poly(vinyl acetate)			
atactic	Acetic acid, acetone, acetonitrile, allyl alcohol, benzyl alcohol, bzn., carbon tetrachloride/ethanol, chlorobenzene, chloroform, dichloroethylene/ethanol (20/80), 2,4-dimethyl-3-pentanol, dioxane, DMF, DMSO, lower aliphatic esters, ethanol/W, glycol ether esters, glycol ethers, methanol, nitromethane, tetrahydrofurfuryl alcohol, THF, toluene	Dil. acids, dil. alkalies, carbon tetrachloride (sw), carbon disulfide, cyclohexanol, diethyl ether (anhydrous, alcohol free), higher esters C > 5, ethanol (anhydrous, sw), ethylene glycol, saturated hydrocarbons, mesitylene, W (sw)	4,5,13
syndiotactic	Chlorobenzene, chloroform	Acetone, bzn.	106
Poly(vinyl trifluoroacetate)	Acetone, chloroform, ethyl acetate, hexamethyldisiloxane		138
Poly(vinyl propionate)	See Poly(vinyl acetate)		
Poly(vinyl *n*-butyrate)	See Poly(vinyl acetate), amyl alcohol, cyclohexane, hexyl acetate		31
Poly(vinyl isobutyrate)	See Poly(vinyl acetate), amyl alcohol, cyclohexane, hexyl acetate		31
Poly(vinyl pivalate)	Acetone, butanone, bzn., ethyl acetate, toluene	Hexane, methanol, W	139
Poly(vinyl caproate)	Bzn.		5

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Poly(vinyl caprylate)	Acetone, aliphatic and aromatic hydrocarbons	Lower alcohols	4
Poly(vinyl laurate)	Aliphatic and aromatic hydrocarbons	Lower alcohols, acetone	4
Poly(vinyl benzoate),	See Poly(vinyl acetate)		5,87
Poly(vinyl chloroacetate)	Chlorobenzene, chloroform, cyclohexanone, dioxane, ethyl acetate, pyridine	Acetone (sw), saturated hydrocarbons	4
Poly(vinyl acetylacetate)	Acetic acid, acetone, chloroform, dioxane, DMF, ethyl acetate, pyridine, THF, saturated aqu. sol. of magnesium perchlorate	Alcohols, bzn., diethyl ether, W	140
Poly(vinyl-*N*-octadecylcarbamate)	Toluene (hot)		327
Poly(vinyl acetate-*alt*-*N*-alkyl/arylmaleimide)	Bzn., chloroform	Petroleum ether	142
1.9. POLY(STYRENES)			
Poly(styrene)			
atactic	Bzn., carbon disulfide, lower chlorinated aliphatic hydrocarbons, chloroform, cyclohexane (above 35°C), cyclohexanone, cyclohexane/acetone, decahydronaphthalene/diethyl oxalate, dimethyl phthalate, dioxane, ethyl acetate, ethylbenzene, glycol formal, MEK, methylene chloride, NMP, 1-nitropropane, phenol/acetone, phosphorus trichloride, THF, tributyl phosphate	Acetic acid, acetone, alcohols, diethyl ether, diols, ethylene chlorohydrin, glycol ethers, saturated hydrocarbons, isobutyl phthalate, phenol, 1,2,3, 4-tetrafluorobenzene (lower than 10°C), tri(chloroethyl) phosphate, tricresyl phosphate	4,5,7, 13,30,143
isotactic	Bzn., chloroform, *o*-dichlorobenzene, toluene		7
syndiotactic	*n*-Tetradecane/decahydronaphthalene (2/1)		144
Poly(4-acetoxystyrene)	THF	Methanol	144
Poly(α-methylstyrene),	See Polystyrene		
Poly(2-,3-, or 4-chlorostyrene)	MEK, THF, toluene		32
Poly(chloromethylstyrene)	Bzn., THF, toluene		32
Poly(4-cyanostyrene)	Acetone, acetonitrile, DMF, DMSO, nitromethane	Bzn., carbon tetrachloride, ethyl acetate, diethyl ether, hexane, methanol	146
Poly(2-,3-, or 4-bromostyrene)	Bzn., THF		5,32
Poly(4-iodostyrene)	Bzn., dioxane, THF		5,32
Poly(2,5-dichlorostyrene)	Ethyl acetate/ethanol (15/1) toluene		5
Poly(2,4,6-tribromostyrene)	THF		32
Poly(4-hydroxystyrene), Poly(*p*-hydroxyphenylethylene)	Methanol and higher alcohols, methyl acetate, THF, THF/chloroform (1/1)	Chloroform, toluene	147,148
Poly(4-methoxystyrene)	MEK, toluene		5
Poly(2,5-dimethoxystyrene)	Bzn., toluene, chloroform	Hexane, methanol	149
Poly(3,4-dimethoxystyrene)	Chloroform		150
Poly(*tert*-butyl-4-vinyl perbenzoate)	Acetone, bzn., chlorohexane, DMF, methylene chloride	Hexane	141
Poly(4-formylphenyl)ethylene, Poly(*p*-formylstyrene)	THF	Hexane, methanol, W	151
Poly(styrenesulfonic acid)	Ethanol, lower glycols, W		32
Poly(styrene-*co*-styrenesulfonic acid) (95 : 5)	DMF, methylene chloride, THF		152
sodium salt	Lower glycols, W		153
Poly(4-trimethylsilylethynylenestyrene)	THF		154
Poly(styrene-*co*-allyl alcohol) (94 : 6)	Alcohols, aromatic hydrocarbons, esters, THF		32
Poly(styrene-*co*-acrylonitrile) (3 : 2)	Chloroform, MEK, methylene chloride, THF	Methanol	7,32,155
Poly(styrene-*co*-*tert*-butoxycarbonyloxystyrene) (4 : 5)	THF, pyridine	Methanol, W	156
Poly(styrene-*co*-butyl methacrylate) (1 : 1)	MEK, toluene		32
Poly(styrene-*alt*-2,4-diamino-6-vinyl-1,3,5-triazine)	DMSO, hexafluoroisopropanol		157

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Poly(styrene-*co*-maleic anhydride)			
(9 : 1)	Cyclohexane/ethyl acetate (3/2)	Methanol	65
(1 : 1)	Acetone, acetonitrile, MEK		32,158
Poly(styrene-*alt*-maleimide)	THF		157
Poly(styrene-*co*-4-thiomethylstyrene) (95 : 5)	THF	Ethanol, hexane	159
Poly(styrene-*co*-4-vinylpyridine) (1 : 1)	DMF, THF		32

1.10. OTHER COMPOUNDS
(alphabetically ordered)

Polymer	Solvents	Nonsolvents	Refs.
Polyacrolein, (redox polymerization)	Above 60°C: pyridine/water (55/45 to 90/10), above 130°C: nitrobenzene, sat. stannous chloride solution, γ-butyrolactone (160–170°C), ethylene carbonate (130–135°C), DMF (153°C), DMSO (160–170°C), divinyl sulfone (150–155°C), TMS (160–165°C)	Lower alcohols, hydrocarbons, chlorinated hydrocarbons, diethyl ether, esters, aromatic ketones	160,161
Polyacrolein (ionic polymerization), See 3.1.1			
Poly(anthrylethylene)	Methylene chloride	Methanol	15
Poly(*N*-benztriazolylethylene)	Chlorinated hydrocarbons, cyclohexanol, DMF, glacial acetic acid	Alcohols, esters, hydrocarbons, ketones, W	162
Poly(biphenylyethylene)	Bzn., dimethoxyethane, toluene	Methanol	163
Poly(*N*-carbazolyethylene), Poly(*N*-vinylcarbazole)	Benzyl acetate, bzn., chlorobenzene, chloroform, cyclohexanone, dioxane, conc. nitric acid, conc. sulfuric acid, tetrachloroethane	Acetals, alcohols, dil. alkalies, dil. carboxylic acids, chlorohydrin, 1-chlorotoluene (sw), diethyl ether, dimethyltetrahydrofuran, diols, aliphatic esters, glycol monoethers, aliphatic ketones, saturated hydrocarbons, trichloroethylene (sw), W	4,6,13, 30,164
Poly[6-(*N*-carbazolyl)hexylethylene]	Acetone, methanol (partially), NMP (123°C)	Methanol	165,166
Poly(diallyldimethylsilane)	Bzn.		167
Poly(3,6-dichloro-*N*-carbazolylethylene)	Dichloroethane	Methanol	168
Poly(2,4-dimethyl-6-triazinylethylene)	Alcohols, bzn., esters, ketones, W (cold)	Aliphatic hydrocarbons, W (ppt. below 73°C)	169
Poly(diphenylphosphinylideneethylene), Poly(vinyldiphenylphosphine oxide)	Bzn., ethanol, methanol, toluene	Hexane, W	170,171
Poly(diphenylthiophosphinylideneethylene), Poly (vinyldiphenylphosphine sulfide)	Bzn., chloroform	Methanol	171
Poly(2-methyl-5-pyridylethylene)	Methanol, DMF		5
Poly(3-morpholinylethylene)	W		172
Poly(1-nitropropylene)	DMF (partially)		173
Poly(2-pyridylethylene), Poly(2-vinylpyridine)	Acetone, alcohols/water, bzn., chloroform, dioxane, ethanol, glacial acetic acid, aqu. mineral acids, nitroethane, pyridine, THF	Carbon tetrachloride toluene, W (sw)	4,13,35, 174,175
crystalline	Aromatic hydrocarbons (reflux), chlorinated solvents, methanol	Aliphatic hydrocarbons (reflux), diethyl ether, MEK	
Poly(4-pyridylethylene), Poly(4-vinylpyridine)	Acetone/W (1/1), benzyl alcohol, bzn., cyclohexanol, dioxane/W (1/1), ethanol/water (92/8), isopropanol/MEK (86/14), methanol, aqu. mineral acids, nitromethane, pyridine, THF	Acetone, diethyl ether, dioxane, ethyl acetate, MEK, petroleum ether, W	5,13,175
Poly(*N*-pyrrolidonylethylene), Poly(*N*-vinylpyrrolidone)	(solubility depending on small amounts of W): acetone, dil. acids, aromatic alcohols, chloroacetic acid esters, chloroform, chlorohydrins, ethanol, glacial acetic acid, methanol, nitromethane, pyridine	Acetic esters, acetone, acid esters, carbon tetrachloride, 1-chlorotoluene, diethyl ether, hydrocarbons, methoxybutyrate esters, nitomethane/W	4–6,13,30

TABLE 1. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Poly(*N*-1,2,4-triazolylethylene)	Glacial acetic acid, DMF, DMSO, W	Alcohols, chlorinated hydrocarbons, esters, hydrocarbons ketone	162
Poly(*N*-vinylthiopyrrolidone)	DMF	Butanol, hydrocarbons, MEK, W	176
Poly(5-vinyl-1,3-benzodioxole)	Chloroform		150
Poly(2-vinylthiophene)	Chloroform	Methanol	177
Poly(vinyl sulfate)	Aqu. NaCl (0.5 M), W		5
Poly(vinylsulfofluoride)	Acetone, DMF, ethyl acetate, THF	Diethyl ether	13
Poly(vinylsulfonic acid)	Acetone, dioxane, ethanol, W	Esters, hydrocarbons, ketones	4,13,179
sodium salt	Methanol, W, aqu. NaCl (0.5 M)	Acetone, methanol	13,179
Poly(vinyl sulfoxide)	Chloroform, DMSO, methanol, W	Acetone, bzn.	180,181
Poly(vinyl 4-methoxyphenyl sulfoxide)	THF	Diethyl ether	182
Poly(*N*-vinylpyrrolidone-*co*-acrylic acid) (3 : 1 to 1 : 3)	Acetone/W (1/1), isopropanol/W (1/1), NMP	Methanol, MEK, THF	183
Poly(vinyl amine), Poly(aminoethylene)	Butanol, DMSO, ethylene glycol, formamide, methanol, W		179,184,185
Poly(vinylformamide)	DMSO, ethylene glycol (partially), formamide, W	Acetone, isopropanol	179,185
Poly(*N*-vinylpyrrolidone-*co*-1-hexadecene) (1 : 2)	Saturated hydrocarbons	*n*-Propanol, W	186
Poly(vinylnaphthalene)	Bzn., dioxane, THF		32
Poly(*N*-vinylpyrrolidone-*co*-vinyl acetate) (1 : 4 to 3 : 2)	Ethanol, isopropanol		186
Poly(*N*-vinylpyrrolidone-*co*-vinyl alcohol) (13 : 1)	Ethanol	Diethyl ether	187
Poly(*N*-vinylpyrrolidone-*co*-vinyl acetate) (1 : 1)	Isopropanol, W		32,681
Poly(*N*-vinylformamide-*co*-methyl 3-phenyl-2-cyanopropenoate) (1 : 1)	DMF, DMSO (partially), NMP	Chloroform, diethyl ether, ethyl acetate, methylene chloride	697
Poly(2-vinylpyridine-*co*-styrene) (7 : 3)	Bzn., chloroform, MEK, THF		32
Poly(4-vinylpyridine-*co*-styrene) (3 : 2)	DMF, THF		32

TABLE 2. MAIN-CHAIN CARBOCYCLIC POLYMERS

Polymer	Solvents	Nonsolvents	Refs.
2.1. POLY(PHENYLENES)			
Poly(2-hydroxy-1,4-phenylene)	Methylene chloride		188
Poly(dihydroxyl-1,4-phenylene), Polyhydroquinone	DMF (partially)	Acetone, chloroform, ethanol	181
Poly(2,5-di-*n*-butoxy-1,4-phenylene)	1,2-Dichloroethane, methylene chloride, nitrobenzene	Methanol	189
Poly(2,5-di-*n*-decyl-1,4-phenylene)	Toluene	Acetone	190
Poly(*N*,*N*-dimethylaniline)	Acetic acid, chloroform, DMF, ethanol	Aqu. sodium hydroxide	191
Poly(2,1′:4′,1″:4″,1‴-quaterphenylene-1,4), Poly [2-(phenyl-1,4-phenylene-1,4-phenylene)-1,4-phenylene]	Toluene	Methanol	192
Poly(2-benzoyl-1,4-phenylene), Poly(2,5-benzophenone)	*m*-Cresol, DMA, methylene chloride, NMP	Methanol	193,194
Poly(nitrophenylene)		All common organic compounds	195
Poly[2-(4-methylbenzoyl)-1,4-phenylene]	DMA		196
Poly(2,5-dihydroxy-1,4-phenylenethenylene)		Common organic solvents, aqu. potassium hydroxide	197
Poly(1,4-benzophenone-*N*-phenyloxime)	DMA, NMP		194
Poly(2,5-dimethoxy-1,4-phenylenethenylene)	Bromoform	Common organic solvents	197,198
Poly(2,5-dimethyl-1,4-phenylenethenylene) low mol. wt.	Chloroform, 1,2- and 1,4-dichlorobenzene		199
Poly(2,5-dimethyl-1,4-phenylenemethylene) low mol. wt.	Chloroform, 1,2- and 1,4-dichlorobenzene (hot)		199
Poly(1,4-phenyleneethenylene), Poly(phenylenevinylene)	Biphenyl, benzyl benzoate, chlorinated biphenyls, diphenyl ether, nitrobenzene		197,200
Poly(1,4-phenylene-1,2-diphenylethenylene)	Chloroform	Methanol	201
Poly[1,4-phenyleneethenylene-1,4-phenyleneethynylene-2,5-(dodecyloxy)-1,4-phenyleneethynylene]	Chloroform, THF, toluene		202
Poly[3-nitro-1,4-phenyleneethenylene-2-(dihexylamino)-1,4-phenyleneethenylene]	Chloroform, 1,2-dichloroethane, THF		203

TABLE 2. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Poly(tetramethyl-1,4-phenylenethenylene)		Bzn., 1-chloronaphthalene (sw), ethanol	197
Poly(5-*n*-dodecyloxy-1,4-phenylene)	DMA, DMF		204
Poly(2,5-di-*n*-decyloxy-1,4-phenylene)	THF	Methanol	205
Poly(2,5-di-*n*-decyloxy-4,4′-biphenylylene)	THF	Methanol	205
Poly[2-bis(methoxycarbonyl)-1,4-phenylenethenylene]	Methylene chloride	Methanol	206
Poly[1,4-phenylene-1,2-di(4-phenoxyphenyl)ethenylene]	Chlorobenzene, chloroform, toluene		207
Poly[2-(2-phenylethenyl)-1,4-phenyleneethenylene]	DMF		208
Poly(6-*n*-hexyl-1,4-naphthalenediylethenylene)	Chloroform	Methanol	209
Poly(2,6-naphthalenediylethenylene)	Tetrachloroethylene (partially)		210
2.2. OTHER COMPOUNDS (alphabetically ordered)			
Poly(acenaphthylene)	Bzn., carbon tetrachloride, chloroform, 1,2-dichloroethane (>30°C), THF, toluene	Acetone, acids, alcohols, dimethoxyethane, ethers	4,32,211
Poly[*N*-(3-bromophenyl)norbornenedicarboximide]	1,2-Dichloroethane, methylene chloride	Methanol	212
Poly(1,3-cyclohexadiene)	Bzn., xylene	Methanol	213
Poly(1,3-cyclohexyleneethenylene)	Bzn.	Methanol	214
Poly(1,5-cyclooctadiene)	Aromatic hydrocarbons, chlorinated hydrocarbons, diethyl ether (partially) methanol (oligomers)	Methanol	215
Poly(cyclopentadiene), 	Bzn., chloroform, dioxane, THF	Ether, hexane, methanol, petrol	216
Poly(1,3-cyclophenylenemethylene)	Toluene (hot)		217,218
Poly(*endo*-dicyclopentadiene)	Bzn., carbon disulfide, chlorobenzene	Acetone, hexane, methanol	219
Poly(2,3-dimethoxycarbonyl-2,5-cyclohexadien-1,4-diylethenylene), Poly(dimethyl barrelene-2,3-carboxylate)	Bzn.	Methanol	206
Poly(1,2-dihydronaphthalene)	Bis(phenoxyphenyl) ether (above 290°C)	Amyl acetate, chloronaphthalene, diphenyl ether, tetrachloroethane, tetrahydronaphthalene	220
Poly(dimethylfulvene)	Acetone, bzn., chlorinated hydrocarbons, diethyl ether, hexane	Alcohol	221
Poly(indene)	Aromatic chlorinated hydrocarbons, diethyl ether, dioxane, drying oils, ketones, pyridine	Acids, aliphatic hydrocarbons (sw), alkalies, lower alcohols, W	6
Poly(1-isopropylidene-3a,4,7,7a-tetrahydroindene)	Bzn., carbon disulfide, chloroform, THF	Acetone, cyclohexane, ethanol, hexane	222
Poly[1,4-phenylene-1,2-dicyano-1,2-bis(propoxycarbonyl)ethenylene]	Acetone, acetonitrile, bzn., chloroform, DMF, DMSO, THF	Diethyl ether, hexane, methanol	164

TABLE 3. MAIN-CHAIN CARBONYL POLYMERS

Poly(carbonyl-1,4-phenyleneoxy-4,4′-biphenylyleneoxy-1,4-phenylene-*co*-carbonyl-1,4-phenyleneoxy-1,4-phenyleneoxy-1,4-phenylene) (1 : 1 to 1 : 3)	Sulfuric acid, 0.1 wt.%		348
Poly(carbonyl-1,3-phenylenecarbonyl-1,4-phenyleneoxy-1,3-phenylenemethylene-1,3-phenyleneoxy-1,4-phenylene)	DMA, DMSO, NMP		345

TABLE 4. MAIN-CHAIN ACYCLIC HETEROATOM POLYMERS

Polymer	Solvents	Nonsolvents	Refs.
4.1. MAIN-CHAIN –C–O–C– POLYMERS			
4.1.1. POLY(OXIDES)			
Unsubstituted			
Poly(oxymethylene), Polyformaldehyde	At elevated temp.: aniline, benzyl alcohol, benzyl benzoate, bromobenzene, γ-butyrolactone, chlorophenols, diphenyl ether, DMF, ethylene carbonate, formamide, malodinitrile, phenol	Lower alcohols, diethyl ether, lower esters, hydrocarbons	4,224,225
Poly(oxyethylene), Poly(ethylene glycol), Poly(ethylene oxide)	Acetonitrile, alcohols, bzn., chloroform, cyclohexanone, esters, DMF, W (cold), aqu. K_2SO_4 (0.45 M above 35°C), aqu. Mg_2SO_4 (0.39 × M above 45°C)	Aliphatic hydrocarbons, ethers, dioxane (sw), W (hot)	4,5,13
Poly(oxyethylidene), Polyacetaldehyde			
amorphous	Alcohols, aromatic hydrocarbons, chloroform, esters, ketones	Aliphatic hydrocarbons	226
crystalline	Chloroform (partially)	Alcohols, esters, hydrocarbons, ketones	226
Poly(oxypropylene), Poly(1,2-propylene glycol), Poly(propylene oxide), crystalline	Acetone, bzn., chloroform, dioxane, DMF, ethanol, methanol (hot), THF	2-Aminoethanol, diethyl ether (sw), ethyl acetate (sw)	13
Poly(oxypropylidene), crystalline	Chloroform (partially)	Common organic solvents	227
Poly(oxyisopropylidene), Polyacetone	Acetone, chloroform		228
Poly(1,3-dioxolane)	Methylene chloride, W (70°C)		229
Poly(oxytetramethylene), Poly(tetrahydrofuran)	Bzn., chloroform, ethanol, THF	Hexane, methanol, petroleum ether, W	230–233
Poly(oxycyclopentenylene)	Bzn., carbon disulfide, chloroform	Methanol	677
Poly(oxycyclohexenylene)	Aliphatic hydrocarbons, chinese wood oil, methyl acetate, toluene	Acetone, ethanol, 2-ethoxyethanol	13
Poly(oxymethylenecyclopropylidenemethyleneoxyhexamethylene)	Methylene chloride	Hexanes	234
Poly(oxy-1,3-phenylene)	Benzophenone, bzn., diphenyl ether, DMF, DMSO, nitrobenzene, 3-pentanol, pyridine	Methanol	235

TABLE 4. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Substituted			32,94,236,237
Polyepichlorohydrin, Poly(oxy-3-chloro-1,2-propylene)	Acetone, bzn., chloroform, diethyl ether, MEK, THF, toluene	Methanol	32,94, 236,237
Poly(oxy-2-chloroethylidene)			
amorphous	Chloroform	Methanol	238
crystalline		Chloroform, methanol	238
Poly(oxy-2-methyltetramethylene)	Bzn., Cloroform	Methanol	239
Poly(oxy-2,2,2-trichloroethylidene), crystalline Polychloral		Chloroform, methanol, other common solvents	227
Poly[oxy-2,2-bis(chloromethyl)trimethylene,	Cyclohexanone	Methanol	237,240
Poly(oxy-2,6-dimethyl-1,4-phenylene), Poly(2,6-dimethyl-1,4-phenylene oxide)			241–244
amorphous	α-Pinene (hot)	α-Pinene (cold), methanol, ethanol	241–244
crystalline	Bzn., chlorobenzene, chloroform, toluene	Ethanol, methanol, nitromethane, α-pinene (hot)	241–244
Poly(oxy-2,6-dichloro-1,4-phenylene)	2-Methoxymethanol	Methanol	688
Poly(oxy-1,4-phenylene-1,2-cyclopropylene-1,4-phenyleneoxymethylene)	Chloroform, DMA, NMP	Methanol	245
Poly(oxy-4,4′-biphenylylene-1,2-propylene-1,4-phenyleneoxydodecamethylene)	Chloroform		246
Poly(1-propynylene-1,3-diyloxy-1,4-phenylene-isopropylidene-1,4-phenyleneoxy-2-propynylene 1,3-diyl)	Toluene		247
Poly[oxyethylene-*co*-oxy(chloromethyl)ethylene] (1 : 1)	Chloroform	Methanol	237
Poly[oxy-3,5-bis(4-carboxyphenyl)-1,4-phenylene-*co*-oxy-3,5-bis(phenyl)-1,4-phenylene] (13 : 87 to 62 : 38)	DMF, DMSO	Chloroform, toluene	248
Poly(oxy-1,4-phenyleneisopropylidine-1,4-phenyleneoxy-*alt*-2-hydroxy-1,3-propylene), Poly(Bisphenol A), epoxy resin	Esters, ethers, ketones		249
Polymeric structures, not 100% specific			
Poly(dimethylketene), $\left[\mathrm{OC}(=\mathrm{C(CH_3)_2})\right]$			
low mol. wt.	Diethyl ether	Methanol	250,251
higher mol. wt.	Bzn., carbon tetrachloride	Chloroform (partially)	250, 251
Polyacrolein, (ionic polymerization) $\left[\mathrm{OCH(CH{=}CH_2)}\right]$	Acetone, bzn., dioxane, THF, DMF	Methanol, petroleum ether	252
Polyacrolein, (redox polymerization) see 1.10			
Poly(α-methylacrolein)	Aniline, γ-butyrolactone, DMF, nitrobenzene, pyridine	Alcohols, hydrocarbons	13
Poly[1,2-di(epoxyethyl)benzene], 	Chloroform, THF		253
Poly(phenyl glycidyl ether)	1,2-Dichlorobenzene (hot), DMF (hot), xylene (hot)	Common organic solvents at rt	254
Poly(glutardialdehyde)			
low mol. wt.	Bzn., chloroform, diethyl ether, THF	Petroleum ether, W	133,197, 255,256
high mol. wt.	Methylene chloride, THF, pyridine	Bzn., (partially)	133,197, 255,256
Poly(β-methylglutardialdehyde), low mol. wt.	Chloroform, diethyl ether, dioxane, THF	Petroleum ether, W	255
Poly(β-phenylglutardialdehyde), low mol. wt.	Bzn., chloroform, diethyl ether, THF, dioxane	Petroleum ether, W	255
Poly(*trans*-1,2-cyclohexanedicarb-oxaldehyde), 	Bzn., chloroform, hexane	Methanol	257
Poly(2-formyl-Δ^5-dihydropyran)	Aromatic hydrocarbons, chloroform, pyridine, THF		258

TABLE 4. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
4.1.2. POLY(CARBONATES)			
Poly(oxycarbonyloxypropylene)	Dioxane, methylene chloride	Methanol, W	678
Poly(oxycarbonyloxyhexamethylene)	Acetone, bzn., chloroform, toluene	Ethanol, ether	13
Poly(oxycarbonyloxy-2,4-dihydroxy-1,4-butylene)	Methylene chloride	Ethanol	260
Poly(oxycarbonyloxy-1,4-butyleneoxycarbonyloxy-1,4-cyclohexylene)	Chloroform, THF		261
Poly(oxycarbonyloxymethylene-1,2-cylcohex-4-enylenemethylene)	Chloroform		262
Poly(oxycarbonyloxy-1,3-phenylene)		Common organic solvents	13
Poly(oxycarbonyloxy-1,4-phenylene)		Common organic solvents	13
Poly(oxycarbonyloxy-1,4-phenylene-isopropylidene-1,4-phenylene), Poly(Bisphenol A carbonate)	Chloroform, *m*-cresol, cyclohexanone, dioxane, DMF, pyridine, THF	Acetone, carbon tetrachloride, lower esters, hydrocarbons, styrene	13,263–265
chlorinated (8% Cl and more)	Bzn., methyl methacrylate, styrene		265
Poly(oxycarbonyloxy-1,4-phenylene-2-pentylidene-1,4-phenylene)	Bzn., chloroform, ethyl acetate		13
Poly(carbon dioxide-*co*-propylene oxide) (1 : 1)	THF	Methanol	266
Poly(propylene carbonate-*co*-propylene oxide) (9 : 1)	Chlorobenzene		267
Poly(oxycarbonyloxy-1,2-cyclohexyleneoxy-1,2-cylclohexylene)	Methylene chloride, THF	Methanol	268
4.1.3. POLY(ESTERS) (alphabetically ordered)			
Poly(ethylene terephthalate), see Poly(oxyterephthaloyloxyethylene)			
Poly(oxyadipoyloxyethylene, Poly(ethylene adipate)	Bzn., THF		32
Poly(oxyadipoyloxy-1,4-phenylene-1,2-propenylene-1,4-phenylene)	Chloroform		269
Poly(oxyadipoyloxytetramethylene), Poly(1,4-butylene adipate)	Chloroform, DMF, THF	Methanol	32,270
Poly(oxyadipoyloxytrimethylene), Poly(1,3-propylene adipate)	Chloroform, MEK, THF		32
Poly(oxyazelaoyloxyethlylene), Poly(ethylene azelate)	Bzn., THF		32
Poly(oxycarbonyl-4,4′-biphenylylenecarbonyloxy-hexamethylene)	Pentafluorophenol/methylene chloride (3/1), THF		271,272
Poly(oxycarbonyl-1,4-cyclohexylene-carbonyloxyoctamethylene), *cis* and *trans*	Chloroform		5
Poly(oxycarbonyldodecamethylenecarbonyloxy-4,4′-biphenylylene)	Phenol/tetrachloroethane (3/2)		273
Poly(oxycarbonylethylene), Poly(β-propiolactone)	Chloroform, formic acid	Hydrocarbons	274,275
Poly(oxycarbonylethyleneoxyethylene)	THF, toluene		278
Poly(oxycarbonylethylidene), Poly(DL-lactic acid)	Acetone, chloroform, toluene	Ethanol	276,277
Poly(oxycarbonylethynylene-1,4-phenylene-ethynylenecarbonyltetramethylene)	DMA	Methanol	279
Poly(oxycarbonyl-2,6-naphthalenediylcarbonyloxy-butylene, Poly(butylene 2,6-naphthalate)	Methylene chloride	Chloroform THF	280,281
Poly(oxycarbonyl-2,6-naphthalenediylcarbonyloxy-ethylene, Poly(ethylene 2,6-napthalenedicarboxylate)	Hexafluoroisopropanol		282
Poly(oxycarbonyl-2,6-naphthalenediyl-*co*-oxycarbonyl-1,4-phenylene) (1 : 3)	Pentafluorophenol/hexafluoro-isopropanol		283
Poly(oxycarbonyloctadecamethylenecarbonyloxyethylene)	Toluene	Methanol	284
Poly(oxycarbonylpentamethylene), Poly(ε-caprolactone), Poly(oxyhexanoyl)	Chloroform, methylene chloride, THF, toluene	Hexane, methanol	285–287
Poly(oxycarbonylpentamethylene-*co*-oxycarbonyl-3-hydroxypentamethylene) (9 : 1 to 1 : 9), Poly(5-hydroxyvaleric acid-*co*-4-hydroxyvaleric acid)	Methylene chloride	Methanol (cold)	288
Poly(oxycarbonyl-1,4-phenylene), Poly(4-hydroxybenzoic acid)	No known solvent		32
Poly(oxycarbonyl-1,4-phenyleneoxyhexamethyleneoxy-1,4-phenylene)	Phenol/*p*-chlorophenol/trichloroethylene (25/40/35)		289

TABLE 4. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.

Polymer	Solvents	Nonsolvents	Refs.
4.2.2. POLY(SILOXANES) (ordered according to increasing complexity)			
Poly(siloxanes) (general)			
fluids and greases	Aromatic and chlorinated hydrocarbons, esters	Moderately conc. acids and alkalies, lower alcohols, W	6
rubbers		Aromatic and chlorinated hydrocarbons (sw), esters (sw)	6
Poly(oxydimethylsilylene), Poly(dimethylsiloxane)	Amyl acetate, chlorobenzene, chloroform, cyclohexyl acetate, dichlorobenzene, 1,2-dimethoxyethane, ethyl bromide, ethyl acetate, *o*-fluorotoluene, hydrocarbons, hydrogenated xylene, isopropyl acetate, MEK (above 20°C), octylamine, phenetol (above 13°C), trichloroethylene	Acetone, acetonitrile, acetophenone, aniline, benzyl alcohol, benzyl acetate, bromobenzene, γ-butyrolactone, Carbitol®, cyclohexanone, cyclohexanol, 1,4-dibromobutane, 1,2-dichloroethane, di(chloroethyl) ether, dichlorobenzene, dimethylnaphthalene, dioxane, diphenyl oxide, ethyl formate, ethyl benzoate, 2-isopropoxyethanol, mesityl oxide, methanol, nitrobenzene, 1-nitropropane	4,5
Poly(oxydiethylsilylene), Poly(diethylsiloxane)	Toluene	W	32
Poly(oxyhydrophenylsilylene)	THF		351
Poly(oxymethylphenylsilylene), Poly(methylphenylsiloxane)	Acetone (hot), butanol, chloroform, diethyl ether, ethyl acetate, toluene	Ethanol, ethylene glycol, methanol	352
Poly(oxymethylhexadecylsilylene)	Chloroform, THF, toluene	W	32
Poly(oxyalkylmethylsilylene)-ω-4-(4-cyanobenzoyl)phenoxy	DMF, toluene	Hexane, methanol	353
Poly(oxydiphenylsilylene), Poly(diphenylsiloxane)	Acetone (hot)	Acetone (cold)	352
Poly[oxybis(3,4-dichlorophenyl)silylene]	Acetone, bzn.		354
Poly(oxydimethylsilyleneethyleneoxydimethylsilylene)	Toluene		355
Poly(oxydimethylsilyleneoxydimethylsilylene-1,4-phenylenedimethylsilylene)	THF		356
Poly[oxymethyl(5-*t*-butoxycarbonyloxy-2-norbornyl)silylene]	Chloroform, toluene	Methanol	357,358
Poly(oxydimethylsilylene-*co*-oxyalkylmethylsilylene), Poly(dimethylsiloxane-*co*-alkylmethylsiloxane)	Aliphatic hydrocarbons, aromatic hydrocarbons, isopropanol	Ethanol, W	359
Poly(oxydimethylsilylene-*co*-oxycarbonyl-1,4-phenyleneisopropylidene-1,4-phenylene) (1 : 3 to 1 : 1)	Bzn., carbon tetrachloride, chloroform, methylene chloride, pyridine, THF		360
4.3. MAIN-CHAIN –C–S–C– AND –C–S–N–POLYMERS			
4.3.1. POLY(SULFIDES) (alphabetically ordered)			
Poly(2,5-dioxopyrrolidine-1,3-diylthio-1,4-phenylene)	Tricresol	Methanol	361
Poly(dithioethyleneoxyethylene)	1,1,2-Trichloroethane (partially), other chlorinated hydrocarbons (partially)	Dil. acids, alcohols, dil. alkalies, bzn. (sw), carbon disulfide, carbon tetrachloride (sw), gasoline (sw), turpentine (sw)	6,178
liquid polymers	Bzn., ethylene dichloride		6,178
Poly(tetrathioethylene)	No solvent known	Dil. acids, alcohols, dil. alkalies, bzn. (sw), carbon tetrachloride, carbon disulfide, gasoline	6,178
Poly(tetrathioethyleneoxyethylene)	1,1,2-Trichloroethane (partially), other chlorinated hydrocarbons (partially)	Dil. acids, alcohols, dil. alkalies, bzn. (sw), carbon tetrachloride, carbon disulfide, gasoline	6,178
liquid polymers	Bzn., ethylene dichloride		6,178
Poly(thio-4,4-biphenylylene)	Biphenyl, dichlorobiphenyl, dimethyl-*p*-terphenyl		362
Poly(thiodifluoromethylene)	Chloroform/methanol	Conc. nitric acid (reflux), aqu. sodium hydroxide (10%, reflux)	363
Poly(thio-2,5-dimethyl-1,4-phenylene)	Hexane, methylene chloride		364
Poly(thiomethylene-1,4-*trans*-cyclohexylene-methylenethiomethylene)	Bzn., chloroform	Methanol, W	365
Poly(thio-1,4-phenylene), Poly(phenylene sulfide)	Biphenyl, *m*-dichlorobenzene, dichlorobiphenyl, dimethyl-*p*-terphenyl, hexachlorobiphenyl	At reflux temp.: 2,4-lutidine, phenyl sulfide, phenyl oxide, pyridine, toluene	362,366, 367

TABLE 4. *cont'd*

= 15–30%	W (sodium salt)		
= high	Acetone, bzn./acetone, bzn./alcohol, chloroform, esters, pyridine		
Cyanoethyl cellulose			6
SC = 8–12%	Alkali		
= 24–32%	W		
= > 50%	Acetone, bzn./acetone, bzn./alcohol, chloroform, esters, pyridine		
7.3.3. CELLULOSE ESTERS			
Cellulose triformate	Formic acid, pyridine		30
Cellulose acetate			
DS = 0.6–0.8	W		
= 1.3–1.7	2-Methoxyethanol	Acetone, W	595
= 2–2.3	Acetic acid (glacial), acetone, aniline, benzyl alcohol, chloroform/methanol, cyclohexanone, diethanolamine, dioxane, ethyl acetate/nitrobenzene, ethylene glycol ethers, formic acid, glycol monoethyl ether acetate, methyl acetate, methylene chloride/methanol (4/1), nitromethane, phenols, pyridine	Aliphatic ethers, hydrocarbons, weak mineral acids	4,6
Cellulose triacetate	Acetone/W (4/1), chloroform/alcohol, chloroform, dioxane, ethyl acetate, ethylene glycol ether acetates, ethylene carbonate, methyl acetate, methylene chloride/ethanol (4/1), methylene chloride, THF, trichloroethane	Acetone (partially), aliphatic hydrocarbons, aliphatic ethers, bzn., chlorobenzene, *o*-chlorotoluene, dichloroethane, ethanol (absolute), glycol ethers, methyl *i*-butyl ketone, weak mineral acids	4–6,30, 598,599
Cellulose acetate hydrogen phthalate	Acetone		32
Cellulose tripropionate	Acetone, bzn., chlorobenzene, dichloroethane, ethyl acetate	*o*-Chlorotoluene, ethanol, hydrocarbons	30
Cellulose tributyrate	Acetone, amyl acetate, bzn., chlorobenzene, chloroform, cyclohexanone, dodecane/tetralin (3/1 above 130°C), ethanol (hot), ethyl acetate, nitrobenzene, THF, xylene (hot)	2-Ethylhexanol, cyclohexane, diethyl ether, hexane, methanol	595
Cellulose tricaproate	Acetone, bzn., chlorobenzene, chloroform, cyclohexanone, diethyl ether, dioxane, DMF, ethanol (hot), ethyl acetate, glacial acetic acid (hot), hexane, nitroethane, THF, xylene	2-Hydroxyethyl acetate, formamide, methanol, nitromethane	595
Cellulose tricaprylate	DMF (above 140°C), 3-phenylpropanol (above 48°C), toluene		5
Cellulose stearate DS = 3	bzn., tetrachloroethane, toluene	Acetone, butyl acetate, dichloroethane, ethyl acetate	595

TABLE 7. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
Cellulose acetate butyrate			
DS (acetate) = 0.5 DS (butyrate) = 2.35	Acetone, amyl acetate, bzn., chloroform, cyclohexanone, dioxane, esters, methanol (hot), nitroethane, tetrachloroethane, toluene (hot)	Aliphatic hydrocarbons, diethyl ether, ethanol, methanol	595
DS (acetate) = 2.1 DS (butyrate) = 0.7	Acetone, chloroform, cyclohexanone, dichloroethane, dioxane, ethyl acetate, nitroethane	Amyl acetate, bzn./methanol (1/4 and 4/1), carbon tetrachloride, diethyl ether, ethanol, hydrocarbons, methanol, W	595
Cellulose tricarbanilate	Acetone, bzn., chloroform, dioxane, DMF, *N*-ethylpyridinium chloride/DMSO (1/1), *N*-ethylpyridinium chloride/pyridine (1/1), pyridine, THF	Methanol, W	7,594, 595
Propyl cellulose benzoate	Acetone, bzn., chloroform, dioxane, DMA, ethyl acetate, pyridine, TMF, toluene, xylene		600
Hydroxypropyl cellulose perfluorooctanoate DS = 3 (ester), DS = 4 (ether)	Acetone	Ethanol	601
7.3.4. CELLULOSE NITRATE AND SULFATE			
Cellulose nitrate			
N = 6.8%	W		602
N = 10.5–12%	Acetic acid (glacial), acetone, alcohol/diethyl ether, alcohol (lower), amyl acetate, ethylene glycol ethers	Higher alcohols, higher carboxylic acids, higher ketones, tricresyl phosphate	4,6,595
N = 12.7%	Acetone, cyclohexanone, ethanol/diethyl ether, ethyl lactate, ethyl butyrate, ethylene carbonate, ethylene glycol ether acetates, furan derivatives, halogenated hydrocarbons, methyl acetate, methyl amyl ketone, nitrobenzene	Dil. carboxylic acids, aliphatic hydrocarbons, aromatic hydrocarbons (sw), diethyl ether, ethylene glycol, higher alcohols (sw), lower alcohols, W	4–6,595
Cellulose sulfate, sodium salt			
DS = 1	W	Ethanol	595
7.4. STARCH AND DERIVATIVES			
Amylose	Ethylenediamine, *N*-ethylpyridinium chloride/pyridine (1/1), DMSO, nitromethane, W (hot), aqu. KOH, aqu. KCl (0.33 M, above 25°C)	*n*-Butanol, diethyl ether	5,7,363,594,595,603
Amylose acetate DS = 2	Chloroform, methyl acetate, nitromethane	W	5
Amylose tricarbanilate	Acetone, dioxane, pyridine		5
Amylopectin	W, W/butanol	Acetone, diethyl ether, ethanol	604
Benzyl amylose DS = 3	Bzn., chloroform, dioxane, DMF, DMSO, THF	Ethanol, methanol, W	605
Starch	Liquid ammonia, aqu. sol. of cupriethylenediamine, fused chloral hydrate, *N*-ethylpyridinium chloride/pyridine (1/1), W (hot, pressure)	Alkali (sw), diethyl ether, W (sw)	6,363, 594,595
Starch, methyl ether			
DS = 0.5–2	W (cold)	W (hot)	595
DS = 3	Chloroform		595
7.5. OTHER POLY(SACCHARIDES)			
Alginic acid	Aqu. alkalies, aqu. sodium carbonate, W (sparingly)	Dil. acids, aqu. calcium salt solutions, hydrophilic organic compounds (sw), hydrophobic organic compounds	6,363
alkali and ammonium salts	Aqu. alkali, W	Organic hydrophobic compounds	6
magnesium and ferrous salts	W	Organic hydrophobic compounds	

TABLE 7. *cont'd*

Polymer	Solvents	Nonsolvents	Refs.
calcium salts	Weak aqu. alkali	Organic hydrophobic compounds, W	
copper, zinc, aluminum salts	Aqu. ammonium hydroxide	Organic hydrophobic compounds, W	
beryllium, chromium, ferric salts		Aqu. alkali, organic hydrophobic compounds	
ι-Carrageenan	W		694
Chitin	Formic acid, conc. mineral acids (degrad.)	Dil. acids, organic solvents	363
Chitosan	Acetic acid, W (pH <6.5)		606
N-[(3′-hydroxy-2′,3′-dicarboxy)ethyl]chitosan	W		607
Glycogen	Dil. trichloroacetic acid	Alcohol	363
Gum arabic	W (warm)	Alcohol	363
Gum tragacanth, Tragacanthin, tragacanthic acid	W	Acetone, alcohol	363
2,3-Di-O-benzyl-(1,5)-α-D-furanan	*o*-Dichlorobenzene (hot)	Acetone, cyclohexanone, ethyl acetate, hexane, methanol	608
Heparin	Dil. alkali solution, alkaline solution of ammonium sulfate, W	Acetic acid, acetone, alcohol	363
Konjac glucomannan	W		609
Pectin	Dil. acids, W	Alcohol	363
Pullulan	W		609
Xanthan gum	W		610
7.6. NATURAL RESINS			
Colophony	Acetone, aromatic hydrocarbons (partially), carbon tetrachloride, chloroform, diethyl ether, ethanol, ethyl acetate, methanol	Aliphatic hydrocarbons	30
Copal	Acetone (25–90%)[a], bzn. (35–60%)[a], carbon tetrachloride (15–40%)[a], chloroform (30–90%)[a], diethyl ether (10–90%)[a], ethanol (20–100%)[a], hydrocarbons (10–55%)[a], methanol (20–70%)[a]		30
Shellac	Acetone (50–80%)*, bzn. (10–20%)[a], carbon tetrachloride (5–15%)[a], chloroform (25–40%)[a], diethyl ether (10–25%)[a], ethanol (85–98%)[a], methanol (100%)	Aliphatic hydrocarbons	30
Zein	Aqu. alcohols, glycols, DMF		32

[a] Percentage soluble, depending on source.

TABLE 8. INORGANIC POLYMERS

Polymer	Solvents	Nonsolvents	Refs.
Poly(phosphorus nitrile chloride)	Bzn., carbon tetrachloride, chloroform, cyclohexane	Aliphatic hydrocarbons	611
Poly(sodium-*m*-phosphate)	Aqu. sol. of LiCl, NaCl or NH_4Cl	Acetone, ethanol, W	612
Poly(tri-*n*-butyl tin fluoride)	Aliphatic hydrocarbons		259
Poly(phosphoryldimethylamide)	Carbon tetrachloride (hot), W	Acetone	613
Poly(2,5-selenienylene)	Chloroform, THF	Methanol, W	614
Poly[η^5-(vinylcyclopentadienyl)tricarbonylmethyltungsten]	Bzn., chloroform, THF	Hexane	615
Poly(*n*-dibutyl stannane)	Chloroform, THF, toluene	Methanol	616

TABLE 9. POLY(ELECTROLYTES)

Polymer	Solvents	Nonsolvents	Refs.
Poly(allyammonium chloride)	W	Methanol	617
Poly(allylammonium phosphate)	HCl, W	Methanol, W	617
Poly(diallyldimethylammonium chloride)	W		618
Poly(benzyltrimethylammonium chloride)	W		32
Poly(diallyldimethylammonium chloride-*co*-*N*-isopropylacrylamide), (2 : 98)	W		619
Poly(sodium trimethyleneoxyethylenesulfonate)	DMSO, W	Bzn., hexane	620
Poly[dimethyldodecyl(2-acrylamidoethyl) ammonium bromide]	W		701
Poly(4-*N*-butylpyridiniumethylene bromide)	Benzyl alcohol, DMSO, nitromethane, W	Bzn., hexane	621
Poly(2-*N*-methylpyridiniumethylene iodine)	Methanol, W	Methylene chloride	687
Poly(*N*-methylpyridinium-2,5-diylethenylene)	DMF, DMSO, NMP, W		583
Poly(4,4′-bipyridiniumdiyl-*N*,*N*′-decamethylene dibromide)	DMF/methanol, W	*tert*-Butyl methyl ether	622
Poly(1,4-pyridiniumdiyl-*N*,*N*′-tetramethylene-4,1-pyridiniumdiylethenylene methylsulfate)	Ethanol	Ethyl acetate	623
Poly(2,6-diphenyl-1,4-pyridiniumdiyl-*N*,*N*′-1,4-phenylene-4,1-pyridiniumdiyl-1,4-phenylene)	DMA, DMF, DMSO, NMP	Diethyl ether	624
Poly[ethyldipropargyl-4-sulfobutyl ammonium betaine]	Formic acid, W	Hexane, methanol, THF, toluene	625

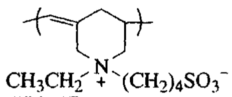

TABLE 10. BLOCK COPOLYMERS

(alphabetically listed)

Polymer	Solvents	Nonsolvents	Refs.
Poly(*t*-butyl methacrylate)-b-polystyrene-b-poly(*t*-butyl methacrylate) (1 : 6 : 1)	Dioxane	Hexane	626
Poly(*t*-butyl methacrylate)-b-poly(oxytetramethylene)-b-poly(butyl methacrylate) (2 : 6 : 2 to 4 : 2 : 4)	Toluene		627
Poly(butyl acrylate)-b-poly[3-(pentamethyldisiloxy)propyl methacrylate] (3 : 1)	THF		628
Poly(butyl vinyl ether)-b-poly(2-ethyloxazoline)	Chlorobenzene, THF	Hexanes	629
Poly(2-cinnamoylethyl methacrylate)-b-poly(acrylic acid) (4 : 5)	Methanol, methylene chloride	Isopropanol/hexane (3/7)	630
Poly(ε-caprolactone)-b-poly(oxytetramethylene)-b-poly(ε-caprolactone) (4 : 2 : 4 to 1 : 3 : 1)	THF, toluene		631
Poly(dimethylsiloxane)-b-poly(6-aminohexanoic acid) (1 : 2)	2,2,2-Trifluoroethanol		632
Poly(2-ethyl-2-oxazoline)-b-poly(lactic acid) (3 : 2 to 2 : 4), Poly(*N*-proponyliminoethylene)-b-poly(oxy-1-oxo-2-methylethylene)	Chlorobenzene	Hexane	633
Poly(3-hydroxybutyric acid)-b-poly(ε-caprolactone) (3 : 5 to 2 : 1)	Chloroform	Methanol	634
Polyisobutylene-b-poly(α-methylstyrene) (9 : 1)	Chloroform	Methanol	635
Poly(methacrylic acid)-b-polystyrene-b-poly(methacrylic acid) (1 : 8 : 1)	Dioxane	Hexane	626
Poly(3-methyl-2,5-thiophenediyl)-b-poly(2-vinylpyrrolidone)	Anisole		636
Poly(oxy-2,2-di(chloromethyl)trimethlylene)-b-poly(oxytetramethylene)-b-polyoxy-2,2-di(chloromethyl)trimethylene (7 : 86 : 7)	Methylene chloride		637
Poly(oxytetramethylene)-b-poly(ε-caprolactone) (1 : 4)	THF, toluene		638
Polystyrene-b-polybutadiene-b-polystyrene) (7 : 86 : 7 to 15 : 70 : 15)	Toluene		639
Polystyrene-b-poly(*tert*-butyl methacrylate) (2 : 3 to 4 : 1)	Dioxane	Hexane	626
Polystyrene-b-poly(dimethylsiloxane) (1 : 1)	THF	Methanol	350
(1 : 9 to 7 : 3)	Bzn./2-methoxyethyl ether, dioxane	Methanol, W	640

A. INTRODUCTION

This section presents a compilation of the specific index of refraction increments, $\nu = dn/dc$, of polymer solutions. This table has been updated since the third edition. The trend of using $\lambda_0 = 633$ nm from the HeNe laser continues and thus the 633 nm data has been given its own column in this compilation. As in the previous edition, most copolymer data has not been included.

Perhaps the most significant change since the previous edition is the coupling of size exclusion chromatography (SEC) with multiple detectors, largely eliminating the need for ν for obtaining molecular weights. In addition, the measurement of the specific refractive index increment has become so routine that many authors no longer report the results of these measurements. These two factors combine to reduce the number of new entries to a mere 46 new references and about 160 new entries.

Finally, the excellent introduction written by Huglin for the third edition has been retained in its entirety and follows this brief introduction.

B. INTRODUCTION FROM THE THIRD EDITION

This is the limiting value at $c = 0$ of the quantity $(n - n_0)/c$, where n and n_0 are the refractive indices of the solution and solvent, respectively, and c (g/ml) denotes the concentration of the polymer in solution. Conditions of constant pressure p, constant temperature T, and a fixed wavelength of light in vacuum, λ_0, are implied. Specific refractive index increments are required to determine the weight-average molecular weight, $\overline{M}_w$, of a polymer and the second virial coefficient, A_2, of a polymer in solution, using the light scattering equation.

$$\frac{K^*c}{R_\Theta} = \frac{1}{\overline{M}_w P(\Theta)} + 2A_2c \qquad (A1)$$

where

$$K^* = K(n_0\nu)^2 \quad \text{and} \quad K = 2\pi^2/N_A\lambda_0^4 \qquad (A2)$$

Here, c is the concentration of the polymer in solution (g/ml) R_Θ (cm^{-1}) is the reduced intensity at an angle Θ, $P(\Theta)$, is the particle scattering function, A_2 is expressed in mol cm^3/g^2, N_A (mol^{-1}) is the Avogadro number. Because

* Based on a table by M. B. Huglin in the 3rd ed. of the Polymer Handbook.

ν appears as a squared term, an error of $E\%$ in ν will result in an error of $2E\%$ in the derived molecular weight, and consequently an accurate determination of ν is imperative. Examination of reported data discloses that about 20 different values of λ_0 have been used by different workers, this increase over the earlier more restricted number being due to growing use of various laser light sources. The values of the constant K appropriate to nine common values of λ_0 are as follows:

$10^7 \times \lambda_0$ (cm)	$10^6 \times K$ (cm^{-4} mol)
366	18.3
403	12.4
436	9.07
488	5.78
514	4.69
546	3.69

For a copolymer comprising monomers A and B or a terpolymer comprising units A, B and C, the specific increment is an additive function of the composition of the polymer expressed in terms of weight fractions w. Thus,

$$\nu = w_A\nu_A + w_B\nu_B \tag{A3}$$

$$= w_A\nu_A + w_B\nu_B + w_C\nu_C \tag{A4}$$

Equations (A3) and (A4) have been verified with copolymer samples of known composition (5,6). In studies on terpolymerization, Kambe and Honda (7,897) have found that the value of ν, from monomer feeds other than the azeotropic composition, changes with conversion, on account of a composition distribution. On the other hand, a constant value of ν, independent of conversion, is yielded for the azeotropic case in which feed and polymer have the same composition. When ν_A and ν_B differ appreciably in a given solvent, Eq. (A3) affords a convenient means of estimating composition from the measured value of ν. If this is not the situation, it is possible to introduce changes in the specific increment by using mixed solvents. The appropriate specific increment to be utilized in light scattering is then ν_μ, that is, one at constant potential of low molecular weight solvent. ν_μ is measured after dialysis equilibrium between solution and pure mixed solvent. ν and ν_μ allow one to obtain the coefficient of preferential adsorption γ_1 (ml/g) of the liquid (solvent 1) in the binary solvent mixture, which has a greater affinity for the polymer:

$$\gamma_1 = (\nu_\mu - \nu)/(\mathrm{d}n_0/\mathrm{d}\phi_1) \tag{A5}$$

In Eq. (A5), $\mathrm{d}n_0/\mathrm{d}\phi_1$ is the variation of the refractive index of the mixed solvent, with its composition expressed in terms of the volume fraction ϕ_1 of liquid 1.

For a copolymer derived from A and B, light scattering always yields the true value of the molecular weight M if $\nu_A = \nu_B$. However, it is not possible to derive the molecular weights M_A and M_B of the constituent portions or the heterogeneity parameters P and Q. If $\nu_A \neq \nu_B$, an apparent value of M is obtained. Tuzar et al. (8) have summarized the criteria for the most sensitive characterization of a copolymer:

Quantity to be determined	Criterion
M	ν_A and ν_B both large and of same sign; or $\nu_A = \nu_B$
M_A	ν_A large and $\nu_B = 0$
M_B	ν_B large and $\nu_A = 0$
Q	$\nu = 0$

Normally, these conditions cannot be satisfied by using single solvents alone, and recourse must be made to using mixed solvents and employing ν_μ, $(\nu_A)_\mu$, and $(\nu_B)\mu$ of the appropriate composition to satisfy them.

The concentration dependence of ν is expressed by the coefficient a_2, in Eq. (A6).

$$(n - n_0)/c = \nu + a_2 c \tag{A6}$$

Lorimer (1) has derived an expression for coefficient a_2 in terms of n_0, ν, and the concentration dependence of the partial specific volume of the polymer in solution, $\bar{v}_2$. However, within the range of c normally used to measure v, the value of a_2 is usually close to zero. Expressions have also been formulated for v in terms of n_0, v_2, and the refractive index of the polymer in solution, n_2. These afford an indirect means of obtaining $\bar{v}_2$ from an experimental value of v (see Refs. 2–5). Actually $\bar{v}_2$ can now be measured to a very high level of accuracy with the Kratky digital densimeter, provided there is an appreciable difference between the densities of polymer and solvent. The main uncertainty or difficulty lies in the value of n_2, when one wishes to calculate ν via $\bar{v}_2$.

1. Measurement and Calibration

Experimental methods and refinements have been summarized elsewhere (4). The main approaches are given below.

Interferometry In this absolute method, light beams of identical geometrical paths traverse two different optical paths and the number (f) of displaced fringes is measured by an optical compensator. If l is the length of the troughs, $(n - n_0)$ is given by

$$(n - n_0) = f\lambda_0/l \tag{A7}$$

When $(n - n_0)$ is very small, for example, in extremely dilute solutions, the accuracy can be enhanced by increasing the trough length. A range of troughs of different lengths is normally available with a commercial instrument. The slope of a plot f versus c, when multiplied by (l/λ_0),

yields the value of ν. Baltog et al. (10) have developed an improved cell which prevents the formation of a liquid film at the central surface with the trough, thus enabling accurate measurements to be made with volatile liquids.

Differences in the dispersion of the refractive index of the solvent and the solute can lead to discontinuities in the plot of f versus c. This problem can be overcome by measuring f for a large number of solutions of gradually increasing concentration, i.e., by the dropwise addition of concentrated polymer solution to pure solvent (5,11).

Differential Refractometry This relies on the image displacement ΔX of beams from the light source, which traverse pure solvent and polymer solution in a divided cell. Adequate temperature control is necessary and it is essential to utilize a stoppered cell to prevent solvent "creep". The method is not an absolute one and necessitates calibration with solutions of accurately known $(n - n_0)$, so that the calibration constant k can be determined for the apparatus:

$$k = (n - n_0)/\Delta X \tag{A8}$$

In Eq. (A8), n is the refractive index of the solution of calibrant, and n_0 that of the solvent. The value of k decreases slightly with increase in λ_0 and must therefore be re-determined if measurements are to be conducted at a different wavelength. A selection of useful calibration data (all involving aqueous solutions) has been gathered from several sources in the literature and is given in Section C. The Brice–Phoenix differential cell is satisfactory for liquids having refractive indices not in excess of about 1.60. At higher values than this, the slit image disappears from the field of vision because of total reflection in the glass partition dividing the cell. Kratochvil and Babka (9) have described a useful modification whereby the partition is replaced with glass of a higher refractive index. This extends the useful range of the different refractometers so that even such highly refractive liquids as 1-bromonaphthalene can be accomodated.

The calibration data at $\lambda_0 = 436$ nm for aq. KCl in Section C have been fitted by Abdel–Azim and Huglin (676) to the following polynomial in which C is the concentration expressed is g salt/100 g water

$$(n - n_0) \times 10^6 = 1.862 + 1415.8C - 17.699C^2 + 0.428C^3$$

Some light scattering and refractometric data relating to wavelengths different from those in Section C have been summarized elsewhere (833). The most common light source for recent light scattering studies is probably the He–Ne laser affording $\lambda_0 = 633$ nm. At this λ_0, directly measured specific refractive index increments for certain aqueous salt solutions have been reported. On the assumption of direct proportionality between $(n - n_0)$ and concentration, these may be represented as follows for $\lambda_0 = 633$ nm and C in g salt/100 g water (Ref. 942):

$$\text{Aq. } NH_4HO_3 \quad (n - n_0) \times 10^6 = 1239C$$
$$\text{Aq. KCl} \quad (n - n_0) \times 10^6 = 1371C$$
$$\text{Aq. NaCl} \quad (n - n_0) \times 10^6 = 1766C$$

Also, for $\lambda_0 = 1086$ nm and C expressed in g salt/100 ml solution, the following holds at 20°C (Ref. 943):

$$\text{Aq. KCl} \quad (n - n_0) \times 10^6 = 1351C$$

Mandel and coworkers (722) have calibrated the Chromatix differential refractometer for $\lambda_0 = 633$ nm and have also indicated the range over which ΔX is directly proportional to $(n - n_0)$. Values of the latter quantity were interpolated to $\lambda_0 = 633$ nm via a Cauchy dispersion from the values at other wavelengths in Section C. Within the interval $3.6 > C > 0.46$ g salt/100 g water, the following polynomial was found for aq. NaCl at 633 nm

$$(n - n_0) \times 10^6 = 1735C - 27C^2 + C^3$$

Abbreviations/Symbols Used

Arochlor	(approximately) Chlorinated diphenyl
(B)	Branched polymer
Cadoxen	Triethylenediamine cadmium hydroxide
Calgon	Sodium hexametaphosphate
Cuoxam	Cuprammonium hydroxide
Cuoxen	Cupriethylenediamine hydroxide
DCA	Dichloroacetic acid
DMA	*N*,*N*-Dimethylacetamide
DMSO	Dimethyl sulfoxide
DN	Degree of neutralization (also α)
DS	Degree of substitution
EDTA	Ethylenediamine tetraacetic acid
FeTNa	Iron–tartaric acid–sodium complex solution
Freon 113	1-Fluorodichloro-2-chlorodifluoroethane
GHCl	Guanidine hydrochloride
Halothane	1,1,1-Trifluoro-2-chloro-2-bromoethane
HEMA	2-Hydroxyethyl methacrylate
HMP	Hexamethyl phosphoramide
I	Ionic strength
M	Relative molar mass (M) or molarity (M), according to context
MEK	Methyl ethyl ketone
MMA	Methyl methacrylate
TEAB	Tetraethyl ammonium bromide
TFP	2,2′,3,3′-Tetrafluoropropanol
THF	Tetrahydrofuran
Versene	Sodium salt of EDTA
(μ)	Specific increment measured at dialysis equilibrium

A. INTRODUCTION: GENERAL RELATIONS FOR A HOMOGENEOUS SOLUTE (1,2)

When electromagnetic radiation interacts with any fluid medium, inhomogeneities in refractive index (dielectric constant) arising from microscopic thermal fluctuations in density and composition cause scattering of a small fraction of the incident radiation. If scattering elements are spatially correlated over distances of the order of magnitude of the wavelength of the exciting radiation, the scattering is subject to optical interferences that affect the angular intensity distribution. This distribution can provide information on the size and shape of macromolecular solutes or suspended colloidal particles: in principle, the molecular radius of gyration is determinable unambiguously, and calculated scattering distributions for idealized models can be compared with experimental data to infer an acceptable molecular conformation. However, an experimental scattering distribution does not permit a unique model assignment in the absence of additional information or supposition.

The limiting dilute-solution behavior of the reduced intensity $R(q, c)$ (Rayleigh's ratio) of light scattered through an angle θ is given by (3)

$$Kc/R(q,c) = 1/MP(q) + 2A_2Q(q,c)c + O(c^2) \qquad \text{(A1)}$$

where M is the molecular weight of the solute, c is the concentration in units of mass/volume, A_2 is the second virial coefficient, and q is an angle variable

$$q = (4\pi\tilde{n}/\lambda)\sin(\theta/2) \qquad \text{(A2)}$$

$\tilde{n}$ denoting the refractive index of the solution, and λ the vacuum wavelength of the incident radiation. In the optical constant (assuming incident radiation polarized perpendicular to the plane containing angle θ)

$$K = \frac{2\pi^2\tilde{n}^2(\partial\tilde{n}/\partial c^2)}{N_A\lambda^4} \qquad \text{(A3)}$$

$\partial\tilde{n}/\partial c$ is the specific refractive index increment at constant pressure and temperature, and N_A is Avogadro's number. The intensity $R(q, c)$ is that due to the solute; the (relatively weak) background solvent scattering is assumed to be that measured for the pure solvent.

The first term on the right-hand side of Eq. (A1) contains the *intramolecular* interference function, or particle scattering factor, defined by (4,5)

$$P(q) = [R(q,c)/R(0,c)]^0 \qquad \text{(A4)}$$

the superscript zero denoting the limit of infinite dilution. Thus the intensity distribution $P(q)$ is normalized to unity at zero scattering angle. Unless particle dimensions are infinitesimally small compared with λ, $P(q)$ is less than unity for $q < 0$; and for particles of less than colloidal dimensions, it is almost always a monotonously decreasing function of q throughout the accessible range of q with visible light.

The second term of Eq. (A1) contains the effects of pairwise interactions between solute molecules (and, implicitly, of interactions involving solvent). The dimensionless angle factor, $Q(q)$, is a function generally unknown, dependent on both *intermolecular* and *intramolecular* correlations (3,6). Like $P(q)$ it is normalized to unity at $\theta = 0$, but usually the approximation is made that $Q(q)$ is unity at all angles so that

$$Kc/R(q,c) = 1/MP(q) + 2A_2c + \cdots \qquad \text{(A5)}$$

replaces Eq. (A1). In all that follows, Eq. (A5), which is Zimm's "single contact" approximation (4), is assumed to hold for any macromolecular species in solution. At $\theta = 0$, Eqs. (A1) and (A5) revert to a thermodynamic equation of a state in virial form.

A scattering entity (polymer molecule, particle) may be represented by n optically isotropic point scattering centers whose spatial arrangement in any given conformation is specified by $n(n-1)/2 \approx n^2/2$ vectors $\mathbf{r}_{ij}$, separating pairs of scattering centers i, j. The scattering function $P(q)$ is then

$$P(q) = n^{-2} \sum_i \sum_j \int F(\mathbf{r}_{ij}) \exp(i\mathbf{q} \times \mathbf{r}_{ij}) \mathrm{d}\mathbf{r}_{ij} \qquad \text{(A6)}$$

The vector $\mathbf{q}$ is the difference between vectorial wave numbers of incident and scattered rays such that $|\mathbf{q}| = q$, as defined above. The nonsubscript i has the usual significance of $(-1)^{1/2}$, and $F(\mathbf{r}_{ij})$ is the probability distribution function (probability density) for the vector $\mathbf{r}_{ij}$. Since the molecules in solution exhibit no preferential orientation in space, $F(\mathbf{r}_{ij})$ is spherically symmetric, and $P(q)$ assumes the form (7)

$$P(q) = \sum_i \sum_j \left\langle \frac{\sin(qr_{ij})}{qr_{ij}} \right\rangle \qquad \text{(A7)}$$

where the pointed brackets indicate averaging over molecular conformations. It is evident from Eq. (A7) that $P(q)$ can be expanded in the even moments of the intramolecular distances $\mathbf{r}_{ij}$. It follows that (7)

$$P(q) = 1 - \frac{1}{3}\left(\frac{4\pi\tilde{n}}{\lambda}\sin\frac{\theta}{2}\right)^2 R_g^2 + \cdots \qquad \text{(A8)}$$

where R_g denotes the root-mean-square (rms) radius of gyration of the molecule about its center of mass

$$R_g^2 \equiv \frac{1}{2n^2} \sum_i \sum_j \langle r_{ij}^2 \rangle^2 \qquad \text{(A9)}$$

B. SCATTERING FACTORS FOR VARIOUS MOLECULAR MODELS (1,2)

The scattering factor $P(q)$ has been calculated for a number of simple molecular geometries. For monodisperse random-flight (Gaussian) coils it is given by (7)

$$P(q)_{\text{coil}} = 2u^{-2}(\mathrm{e}^{-u} + u - 1) = 1 - u/3 + \cdots \qquad \text{(B1)}$$

$$u \equiv (nb^2/6)q^2 = R_g^2 q^2 \qquad \text{(B2)}$$

where n is the number of equivalent statistical segments of root-mean-square length b in the chain.

For a flexible-ring model (a long chain of Gaussian segments constrained to have ends joined), $P(q)$ is given by (8)

$$P(q)_{\text{ring}} = 2u^{-1/2} I_D(u^{1/2}/2) \qquad \text{(B3)}$$

where

$$I_D(x) = \exp(-x^2) \int_0^x \exp(t^2)\mathrm{d}t \qquad \text{(B4)}$$

is Dawson's integral, for which tabulations are available (9). The variable u is defined as in the first equality in Eq. (B2), so that in this case $u = 2q^2 R_{g,\text{ring}}^2$ since the mean-square radius $R_{g,\text{ring}}^2$ is $nb^2/12$.

For flexible regular-star branched molecules with f identical arms (f random-flight chains starting from a common node), $P(q)$ is given by (10,11)

$$P(q)_{\text{star}} = \frac{2}{u^2}\left[\frac{f(f-1)}{2}\mathrm{e}^{-2u/f} - f(f-2)\mathrm{e}^{-u/f} + u + \frac{f(f-3)}{2}\right] \qquad \text{(B5)}$$

The mean-square radius of the star model is $[(3f-2)/f^2][nb^2/6]$. Scattering functions have also been calculated for certain random-flight comb-shaped models of flexible backbones with uniform side chains (11). Provided $q^2 R_g^2 \leq 2$, a good approximation to $P(q)$ for a variety of branched chains and for the ring model is afforded by the form of Eq. (B1) for a linear chain with u replaced by gu, g denoting the ratio of the mean-square radius of the nonlinear structure to that of the linear chain of the same mass (2,10).

Strictly, Eqs. (B1–B5) apply only to flexible chain molecules in a theta solvent. To account approximately for the chain expansion in a good solvent, the most obvious expedient is to increase the statistical mean-square segment length b^2 by the same factor as that for the increase of the overall mean-square radius over the unperturbed value and assume that the foregoing equations still apply. Several derivations (12–15) however, recognize the non-Gaussian character of the segment distribution perturbed by the excluded volume effect. Scattering factors have also been obtained for another type of modification of the random flight, the "wormlike" chain of Kratky and Porod, which introduces a persistence length to account for chain "stiffness" (1,16).

For thin cylindrical rods of length L, $P(q)$ is (7,17,18)

$$P(q)_{\text{rod}} = \frac{1}{y}\mathrm{Si}(2y) - \left(\frac{\sin y}{y}\right)^2 = 1 - \frac{1}{9}y^2 + \frac{2}{225}y^4 - \frac{1}{2205}y^6 + \cdots \qquad \text{(B6)}$$

where $y = qL/2$, and

$$\mathrm{Si}(x) = \int_0^x \frac{\sin w}{w}\mathrm{d}w \qquad \text{(B7)}$$

The "sine integral" function $\mathrm{Si}(x)$ is given in standard tabulations (9). For large y this $P(q)$ function asymptotically approaches $(\pi/2y) - (1/2y^2)$; and, in fact, the asymptotic relation is less than 1% in error for $y > 4$. The four terms of the series form given in Eq. (B6) are within 1% of the correct value for $y < 2$.

For spheres of diameter D, $P(q)$ is (7,18)

$$P(q)_{\text{sphere}} = [(3/v^3)(\sin v - v\cos v)]^2 = 1 - \frac{1}{5}v^2 + \cdots \quad \text{(B8)}$$

where $v = qD/2$; and for thin disks of diameter D, the function is (18)

$$P(q)_{\text{disk}} = \frac{2}{w^2}\left[1 - \frac{1}{w}J_1(2w)\right] = 1 - \frac{1}{6}w^2 + \cdots \quad \text{(B9)}$$

with $w = qD/2$, and $J_1(x)$, the Bessel function of the first kind, of order one (9).

Scattering factors have been calculated for a variety of more complicated particles; e.g., oblate and prolate ellipsoids, cylinders of finite thickness, shells of different forms, particles of nonuniform density, and assemblages of simple geometrical shapes (see Ref. 19 and citations therein).

C. EFFECTS OF DISPERSION IN MOLECULAR WEIGHT (2)

For a mixture of solutes all having the same specific refractive increment, e.g., a polymer heterogeneous in molecular weight, the reciprocal scattering function in Eq. (A5), for the single-contact approximation, is replaced by (2, 20–22)

$$\frac{Kc}{R(q,c)} = \frac{1}{M_{\text{w}}P_X(q)} + 2A_{2,\text{app}}c + \cdots \quad \text{(C1)}$$

Here, M_{w} denotes the weight-average molecular weight $\sum_i M_i w_i$, M_i being the molecular weight of the ith solute and w_i its weight fraction in the solute mixture; c is the total solute concentration. The measured particle scattering factor is the average

$$P_X(q) = M_{\text{w}}^{-1}\sum_i M_i P_i(q) w_i \quad \text{(C2)}$$

where $P_i(q)$ is the scattering factor for the ith polymer. The quantity $A_{2,\text{app}}$ is an apparent, angle-dependent second virial coefficient

$$A_{2,\text{app}} = \sum_i\sum_j B_{ij}M_i w_i P_i(q) M_j w_j P_j(q)/[M_{\text{w}}P_X(q)]^2 \quad \text{(C3)}$$

where B_{ij} is the virial coefficient for interaction between components i and j (B_{ii} is just A_2 for a solution of component i alone). At the limit $\theta \to 0$, $A_{2,\text{app}}$ reduces to a true thermodynamic quantity:

$$\lim_{\theta\to 0} A_{2,\text{app}} = A_2^{(\text{LS})} = M_{\text{w}}^{-2}\sum_i\sum_j B_{ij}M_i w_i M_j w_j \quad \text{(C4)}$$

which might be described as a "light-scattering-average" second virial coefficient (to distinguish it from the analogous average obtained from an osmotic pressure experiment).

Series expansion of $P_X(q)$ gives an average over the mean-square radii of gyration R_{gi}^2 of the solute species

$$P_X(q) = 1 - (q^2/3)R_X^2 + \cdots \quad \text{(C5)}$$

$$R_X^2 = M_{\text{w}}^{-1}\sum_i R_{\text{g}i}^2 M_i w_i \quad \text{(C6)}$$

The average R_X^2 is sometimes called the Z-average mean-square radius (for a distribution of random-flight chain species R_X^2 is proportional to the so-called Z-average molecular weight

$$M_z = \sum_i (M_i^2 w_i/M_{\text{w}}) \quad \text{(C7)}$$

Angular scattering functions $P_X(q)$ have been calculated for various molecular size distributions. In particular, distributions of linear random-flight chains have been studied for the exponential weight-fraction distribution of Schulz and Zimm (20)

$$w(M) = \frac{b^{h+1}}{\Gamma(h+1)}M^h e^{-bM} \quad \text{(C8)}$$

with $b = (h+1)/M_{\text{w}} = h/M_{\text{n}}$, $\Gamma(x)$ the gamma function, and the dispersion parameter $h = 1/[M_{\text{w}}/M_{\text{n}}) - 1]$. For a system of random flight chains with this distribution, the averaged scattering factor is

$$P_X(q) = \frac{2}{h(h+1)}\left(\frac{h+2}{u_X}\right)^2\left[\left(\frac{u_X}{h+2}+1\right)^{-h} + \frac{h}{h+2}u_X - 1\right] \quad \text{(C9)}$$

where $u_X = q^2R_X^2$. For a monodisperse polymer, h is infinite; and for increasing dispersion in molecular weight it decreases towards zero. It is unity for the "most probable" distribution (characteristic of the products of step-growth polymerization at high conversion and of free-radical polymerization at low conversion with chain transfer). In this special case, $P_X(q)$ for random-flight linear chains is given by the very simple relation (20)

$$[P_X(q)]^{-1} = 1 + \frac{1}{3}u_X \quad \text{(C10)}$$

Plots of $[P_X(q)]^{-1}$ versus u_X for $h < 1$ curve upward, and for $h > 1$ curve downward.

The asymototic dependence of $[P_X(q)]^{-1}$ for heterogeneous chains at large q is (23)

$$\frac{1}{P_X(q)} \sim \frac{M_{\text{w}}}{2M_{\text{n}}} + \frac{M_{\text{w}}}{2M_z}u_X \quad \text{(C11)}$$

so that, in principle, this dependence could provide information on M_{n}. In practice, the experimental limit on q imposed by the upper bound on θ of 180° makes it difficult to ascertain whether the asymptotic behavior is accessible, even for polymers of high molecular weight.

Calculations for branched monodisperse Gaussian chain models and for systems with certain distributions of

References page VII-635

branching and molecular weight suggest as a reasonable approximation for such heterogeneous systems in general, the $P_X(q)$ obtained by replacement of the variable u in Eq. (B1) by $(u_X)_1 R_X^2/(R_X^2)_1$, where $(u_X)_1$ and $(R_X^2)_1$ denote u_X and R_X^2, as defined above, for the system of linear chains with the same weight distribution as the structurally heterogeneous system. Derivations of $P(q)$ for randomly branched systems have been based on cascade models and moment generating functions (24–26). Branching and molecular-weight dispersion have opposing effects on the $P(q)$ function and in randomly branched systems are largely compensatory (2,26). Interestingly, however, the asymptotic behavior of $P(q)$ for Gaussian chains is unaffected by chain branching; it depends only on molecular weight and weight distribution (10).

$P_X(q)$ has been obtained in closed analytical form for systems of thin rodlike (cylindrical) particles distributed in length (and therefore in mass) according to Eq. (C8) for integral values of the parameter h (27). For $h = 1$, the result is

$$P_X(q) = y_w^{-1} \arctan y_w \qquad \text{(C12)}$$

where $y_w = (q/2)\sum_i L_i w_i$, L_i being the length of the ith rod species. For large qL, the asymptotic dependence of $[Kc/R(\theta)]^\circ$ on q (not q^2) for rods of uniform diameter and density is linear, and the slope of the plot is $(L_i/M_i)/\pi$: i.e., the slope yields the linear density or mass per unit rod length, independent of any dispersion in L (28). If the rods are heterogeneous in diameter, the limiting slope is $[\pi \sum_i (M_i w_i/L_i)]^{-1}$. Unlike the asymptotic behavior for Gaussian coils, this asymptotic dependence for rods is manifested in practical situations with both synthetic polymers and biopolymers. Some care in interpretation is needed, however. For thin oblate ellipsoids ("needles"), a model seemingly scarcely different from thin cylinders, the asymptotic dependence of $[(Kc/R(\theta)]^\circ$ on q is also linear but with slope 5/6 that for the cylinder system (28).

D. DETERMINATION OF MOLECULAR WEIGHT AND RADIUS OF GYRATION

In general, information from a light scattering experiment on a polymer/solvent system consists of an array of intensity data determined at a number of concentrations and a number of angles. These are usually represented as values of the reciprocal intensity function $Kc/R(\theta, c)$. The form of Eq. (A5) suggests use of the popular Zimm plot: i.e., the values of $Kc/R(\theta, c)$ are plotted against $C_1 c + C_2 \sin^2(\theta/2)$, with C_1 and C_2 being arbitrary constants chosen merely to separate data points conveniently, to form a gridlike pattern (4,20). In conformity with Eq. (A5), a homogeneous polymer gives contours at constant angles (θ) that form a family of parallel straight (or nearly parallel and straight) lines, and contours at constant concentrations that form another family of curves of similar shape, displaced from one another by translations. This representation, shown schematically in Figure 1, facilitates simultaneous extrapolations of angular data to zero concentration and concentration data to zero angle, and extrapolation of both limiting dependences to a common intercept $[Kc/R(0,c)]^\circ$. In general, the ratio of the initial slope to the intercept of the angular plot extrapolated to $c = 0$ is $16\pi^2\tilde{n}^2 R_X^2/3\lambda^2$; the slope of the concentration dependence extrapolated to $\theta = 0$ is twice the averaged second virial coefficient $A_2^{(LS)}$; and the double limit $[Kc/R(0,c)]^\circ$ is M_w^{-1}. The dominant cause of lack of parallelism of the contours in experimental Zimm plots is dispersion in molecular weight (cf. Eqs. C19, C21).

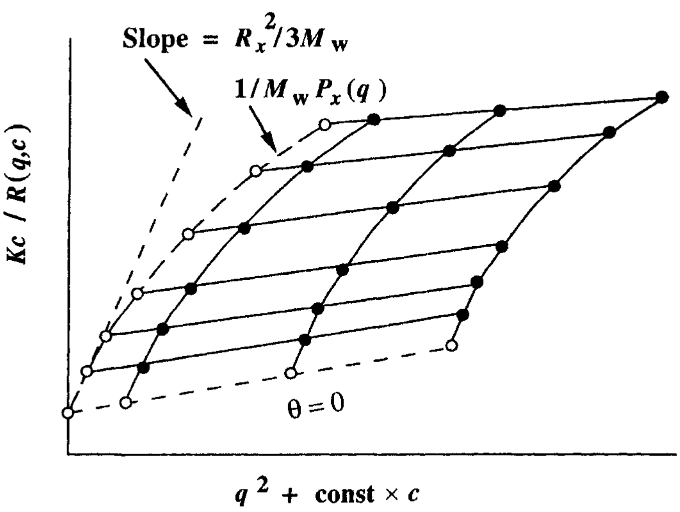

Figure 1. Schematic Zimm plot for a solute polydisperse in molecular weight, illustrating empirical determination of averaged molecular weight M_w, scattering factor $P_x(q)$, and radius of gyration R_x according to Eq. 19. The filled circles simulate experimental data; the open circles represent extrapolations to zero scattering angle and zero concentration.

If both the molecular architecture of a polymer in solution and its molecular weight dispersion are known, the scattering function $P_X(q)$ is known (in principle) and can be combined with limited angular scattering data to deduce M_w and R_X^2. Thus, in the "dissymmetry" method (7) scattered intensities at 90° and the ratio of intensities at 45° and 135° (or another pair of complementary angles) are measured for each concentration. Then the extrapolated transverse scattering function $[Kc/R(q_{90})]^\circ$ and the extrapolated dissymmetry ratio

$$Z_{45} = [R(q_{45}, c)]/R(q_{135}, c)]^\circ \qquad \text{(D1)}$$

determine the molecular weight and radius of gyration, given the $P_X(q)$ function. Tables correlating Z_{45} with $P^{-1}(q_{90})$ and the molecular dimensions have been compiled for monodisperse coils (5,29), rods (5,29), spheres (5,29), and disks (5,29,30), and for polydisperse coils (5,31).

Except for routine characterization of systems of well known character exhibiting low dissymmetry, the dissymmetry method cannot be recommended if a photometer is available that is capable of a full complement of angular readings. Apart from the desirability of determining M_w and R_X^2 without assumptions, it is

helpful to have the maximum amount of information as an aid in detecting any spurious angular dependence of scattering due to instrumental artifacts or to contamination by "dust".

In current practice, photometers that do not provide scattering measurements over a continuous angular range, are typically dedicated to the limited task of monitoring the output stream in size exclusion chromatography, perhaps on line with other detection modes. In this application, passage of the polymer through the chromatographic column effectively eliminates the problem of contamination by foreign particulate matter. One popular instrument of this kind reads scattering only at right angles and at 15°.

E. CALCULATIONS OF SCATTERING FACTORS

Figure 2 and Tables 1 and 2 illustrate some quantitative comparisons among scattering factors for several molecular models and the effects of dispersion in molecular weight for Gaussian coils. Tables of $P(q)$ and Z_{45} in the older literature are much more extensive and reflect the needs of a time without widely available computer technology. Today, for careful work to compare experimental $R(q, 0)$ data with theoretical scattering functions, investigators will find it preferable to return to the mathematical functions and write computer routines to do calculations for data analysis rather than to routinely interpolate in tables. For those who may wish to use a traditional programming language such as FORTRAN, the following rational approximation formulas will facilitate accurate calculation of the special functions that appear in the various expressions for $P(q)$.

The sine integral Si(x) for $x \leq 1$ (Refs. 32,33):

$$\mathrm{Si}(x) = \frac{\pi}{2} - f(x)\cos x - g(x)\sin x$$

$$f(x) = \frac{1}{x}\left(\frac{a_0 + a_2x^2 + a_4x^4 + x^6}{b_0 + b_2x^2 + b_4x^4 + x^6}\right) + \epsilon$$

$$a_0 = 8.493336 \quad a_2 = 47.411538 \quad a_4 = 19.394119$$

$$b_0 = 30.038277 \quad b_2 = 70.376496 \quad b_4 = 21.361055$$

$$10^6|\epsilon| < 8$$

$$g(x) = \frac{1}{x^2}\left(\frac{a_0 + a_2x^2 + a_4x^4 + x^6}{b_0 + b_2x^2 + b_4x^4 + x^6}\right) + \epsilon$$

$$a_0 = 5.08904 \quad a_2 = 49.719775 \quad a_4 = 21.383724$$

$$b_0 = 76.707878 \quad b_2 = 119.918932 \quad b_4 = 27.177958$$

$$10^6|\epsilon| < 6$$

The Bessel function $J_1(x)$ for $0 \leq x \leq 3$ (Ref. 34):

$$x^{-1}J_1(x) = \frac{1}{2} - 0.56249985(x/3)^2 + 0.21093573(x/3)^4 - 0.03954289(x/3)^6 + 4.43319 \times 10^{-3}(x/3)^8 - 3.1761 \times 10^{-4}(x/3)^{10} + 1.109 \times 10^{-5}(x/3)^{12} + \epsilon$$

$$10^8|\epsilon| < 1.3$$

The Bessel function $J_1(x)$ for $x \geq 3$ (Ref. 34):

$$x^{1/2}J_1(x) = f_1 \cos\theta_1$$

$$f = 0.79788456 + 1.56 \times 10^{-6}(3/x) + 0.01659667(3/x)^2 + 1.7105 \times 10^{-4}(3/x)^3 - 2.49511 \times 10^{-3}(3/x)^4 + 1.13653 \times 10^{-3}(3/x)^5 - 2.0033 \times 10^{-4}(3/x)^6 + \epsilon$$

$$10^8|\epsilon| < 4$$

$$\theta_1 = x - 2.35619449 + 0.12499612(3/x) + 5.650 \times 10^{-5}(3/x)^2 - 6.37879 \times 10^{-3}(3/x)^3 + 7.4348 \times 10^{-4}(3/x)^4 + 7.9824 \times 10^{-4}(3/x)^5 - 2.9166 \times 10^{-4}(3/x)^6 + \epsilon$$

$$10^8|\epsilon| < 9$$

Modern mathematics programs such as Mathematica and Maple constitute higher level languages that make possible direct operations with special functions on a personal computer (35,36).

F. PARTICLE SCATTERING FACTORS AND DISSYMMETRIES

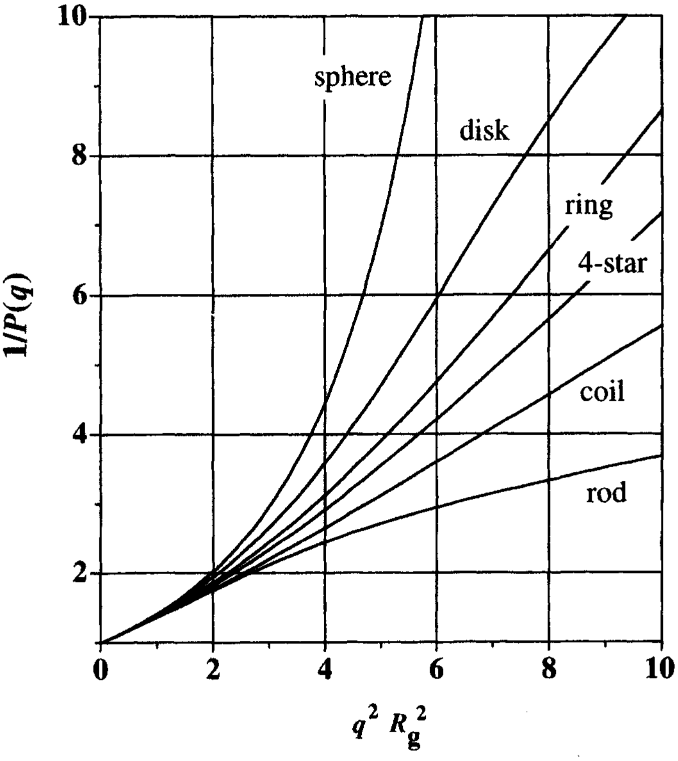

Figure 2. Reciprocal scattering factors $1/P(q)$ versus $q^2R_g^2$ for monodisperse systems of the models indicated. R_g^2 is: $nb^2/6$ (linear Gaussian coil); $5nb^2/48$ (4-branch regular star); $nb^2/12$ (flexible ring); $L^2/12$ (thin rod); $D^2/8$ (disk); $3D^2/20$ (sphere).

TABLE 1. DISSYMMETRIES FOR MONODISPERSE SYSTEMS

	Z_{45} and $P^{-1}(q_{90})$				
$R_g\tilde{n}/\lambda$	Coil	4-Star[a]	Rod	Disk	Sphere

A. INTRODUCTION

Each conformation of a polymer chain has a dipole moment, μ, in Debye units D ($=10^{-18}\times$ u.e.e. $\times$ 1 cm or 3.338×10^{-30} C $\times$ m), equal to the vectorial sum of the moments of N dipolar groups along the chain, that is, $\mu(\zeta)=\sum_i m_i$, where m_i is the dipole moment associated with the skeletal bond i in the conformation ζ. The mean-square dipole moment $\langle\mu^2\rangle$ can be written as (22,91)

$$\langle\mu^2\rangle=\left\langle\sum_i\sum_j m_i m_j\right\rangle=\sum_i m_i^2+\left\langle\sum_i\sum_{i\neq j} m_i m_j\right\rangle \tag{A1}$$

where m_i and m_j are the dipole moments associated with the skeletal bonds i and j, respectively, and the brackets mean averages. For a freely jointed chain, the last term in Eq. (A1) averages to zero, and the corresponding mean-square dipole moment is given by

$$\langle\mu^2\rangle=\sum_i^N m_i^2 \tag{A2}$$

The values of the mean-square dipole moment are currently expressed in terms of the dipole moment ratio, $D_n=\langle\mu^2\rangle/\sum m_i^2$, or the dipolar correlation coefficient, g, by means of the following expression:

$$g=D_n=1+\frac{\left\langle\sum_i\sum_{i\neq j} m_i m_j\right\rangle}{\sum_i m_i^2} \tag{A3}$$

Debye (13) pioneered the theories which allow calculation of the dipole moments of molecules in the vapor or gas phase. Other theories (23,32,53) developed to determine the dipole moments of molecules in the liquid state were not so successful because of the difficulties involved in defining the internal field in a polar, condensed medium. This problem was circumvented by calculating the dipole moment of polymers and polar liquids in very dilute solutions using nonpolar solvents. In this way, the solute molecules are separated from one another by nonpolar molecules, and the dielectric behavior of the system resembles that of a gaseous condition. The method developed by Guggenheim (27) and Smith (106), based on this approach, permits calculation of the mean-square dipole moments of polymers by means of the following equation:

$$\langle\mu^2\rangle=\frac{27\,k_B MT}{4\pi\rho N_A(\varepsilon_1+2)^2}\left[\frac{d\varepsilon}{dw}-\frac{dn^2}{dw}\right] \tag{A4}$$

where k_B and N_A are, respectively, the Boltzmann constant and Avogadro's number, M is the molecular weight of the solute, T the absolute temperature, ρ and ε_1 the density and the dielectric permitivity of the solvent, respectively. The term $d\varepsilon/dw$ (proportional to the total polarization of the solute) can be obtained from plots of the dielectric permitivity of the solution, ε, against the weight fraction of solute w, in the limit $w \to 0$. The values of dn^2/dw (proportional to the electronic polarization) can be obtained from the increments of the indices of refraction of the solution n with respect to that of the solvent n_1, also in the limit $w \to 0$. A shortcoming of this equation is that a ficticious atomic polarization (instead of the true one) is assumed. However, with the exception of the silicones, the atomic polarization for most systems is less than 10% of the electronic polarization and, consequently, the error involved in the determination of $\langle \mu^2 \rangle$ with Eq. (A4) is negligible. The mean-square dipole moment presents some advantages over other more traditional conformation-dependent properties such as the mean-square end-to-end distance $\langle r^2 \rangle_0$. For example, since the skeletal bonds change much more in polarity than they do in length, $\langle \mu^2 \rangle$ is usually more sensitive to structure than $\langle r^2 \rangle_0$. Moreover, with the exception of a relatively few number of polymers that have dipole moments in their structure with a component parallel and the other perpendicular to the chain contour, excluded volume effects are negligible.

In the tables, the dipole moments are expressed in terms of either the dipolar correlation coefficient g, or the mean-square dipole moment per repeating unit, $\langle \mu^2 \rangle / x$. For relatively long chains in which dipole contributions of the end groups are not important, $\langle \mu^2 \rangle / x$ and g are related by

$$\frac{\langle \mu^2 \rangle}{x} = g\mu_0^2 \qquad \text{(A5)}$$

where x is the degree of polymerization, and μ_0^2 is the sum of the squares of the dipole moments associated with the repeating unit. Below the generic name of each family of polymers, the dipole moments associated with the backbone are indicated.

B. DIPOLE MOMENTS OF POLYMERS IN SOLUTION

TABLE 1. POLYOXIDES (POLYETHERS)*

Polymer	Solvent	Temp. (°C)	g or D_n	$\langle \mu^2 \rangle / x$, D^2	Remarks	Refs.
Poly(oxymethylene)						
Polyformaldehyde						
With $x=1$	Benzene	25	0.1			109
With $x=2$	Benzene	25	0.29			109
With $x=$ infinite	Melt	202	0.3			56
Poly(oxyethylene)						
Poly(ethylene oxide)						
$x=2-6$	Benzene	20		1.32–1.23	End groups: $-OC_2H_5$	47
$M_n=4000$	Benzene	20–60	0.603–0.644		$m(CH_2-O)=0.99D$	59
$x=1-6$	Benzene	25		1.30–1.14	End groups: $-OC_2H_5$	34
$x=4.0-176.2$	Benzene	25		2.82–1.28		46
$x=4.1-153.0$	Benzene	25		2.59–1.28		2
$x=1-33.6$	Benzene	20		1.99–1.19		45
$M_n=4000$	Benzene	20–60	0.621–0.693		$m(CH_2-O)=0.99D$	4
$x=1-7$	Dioxane	25		2.82–1.66		110
$x=2-227$	Benzene	20–30		2.13–1.14		47
Poly(oxypropylene)						
Poly(propylene oxide)						
$x=6.6-69.0$	Benzene	25		1.96–1.04		45
	Benzene	25	0.54		Isotactic	1
	Dioxane	25	0.49		Isotactic	1
Poly(oxytrimethylene)						
Poly(trimethylene oxide)	Benzene	25	0.41			50
Poly[oxy(2,2-dimethyltrimethylene)]						
Poly(3,3-dimethyloxetane)						
$M_n=8500$	Benzene	20–60	0.25–0.30			94
$M_n=19000$	Benzene	30–60	0.20–0.22			25
$M_n=35000$	Benzene	30–60	0.21–0.23			25
Poly[oxy(1-methyltrimethylene)]						
Poly(2-methyloxetane)						
$M_n=13000$	Cyclohexane	30–60	0.36–0.41			78
Poly[oxy(2-methyltrimethylene)]						
Poly(3-methyloxetane)						
$M_n=125000$	Cyclohexane	30–60	0.35–0.38			77

*If not indicated otherwise, the dipole moments associated with the skeletal bonds used in the calculation of g were $m(CH_2-O)=1.07D$, $m(CH_2-CH_2)=0D$, and $m(O-H)=1.7D$.

A. INTRODUCTION

Tabulated below are references to the studies of the enthalpy, entropy, and volume changes that occur when polymer and solvent are mixed to form a homogeneous liquid solution. This bibliography follows closely the form employed by C. Booth (Manchester) in his contribution under the same title in the second edition of this Handbook. With several exceptions, references to work reported before 1972 were compiled by Professor Booth for the second edition.

1. Scope of the Table

This table includes literature citations to studies from which the thermodynamic properties named in the title can be deduced. The experimental methods utilized are also identified.

This tabulation is limited to reports of measurements on solutions that contain only one nonelectrolyte homopolymer; solutions with a copolymer, polyelectrolyte, or polymer mixture have been excluded. Solvents for the solutions in this compilation are liquids comprising single molecular entities; i.e., references to studies in which the solvent is a binary or ternary mixture or a mixture of oligomers are not included.

Most studies whose primary goal is to characterize the individual polymer molecule and its interaction in an infinitely dilute solution will not be found in this table. However, references to studies of dilute solutions are presented in some of the other tables of Part VII ("Solution Properties"). Most of the reports of changes in free energy on mixing or on dilution cited here have been limited to those that also provide sufficient data to determine the change in the enthalpy (or entropy). References to measurements of solvent activities which can yield information about changes in free energy can be found in "Polymer–Solvent Interaction Parameters".

These references were collected without regard for the quality of data.

2. Experimental Methods

Heat Several different kinds of enthalpy changes are recognized in the formation of solutions. The *integral heat of mixing or integral heat of solution,*

$$\Delta H_{\text{mix}} = H_{\text{soln}} - n_1 H_1^0 - n_2 H_2^0 \qquad \text{(A1)}$$

is the heat absorbed when pure solvent and pure polymer are combined to form a solution at constant temperature and pressure. Here H_{soln}, H_1^0, and H_2^0 are the molar enthalpies of solution, pure solvent, and pure solute respectively; and n_1 and n_2 the number of moles of each component. The value of ΔH_{mix} is dependent on the degree of crystallinity for semicrystalline polymers and, usually to a lesser extent, on the thermal history of glassy polymers. However, if a

polymer solution already exists and more solvent is added, the accompanying enthalpy change, which is called the *integral heat of dilution*, is independent of any crystalline or glassy aspect of the pure polymeric solute. The integral heats, both of mixing and of dilution, are usually determined calorimetrically. The latter is often preferable for experimental reasons, because its measurement is not complicated by the long dissolution times usually required in the direct measurements of integral heats of solution.

The *partial* or *differential heat of solution*, $\overline{\Delta H_2}$, is the change in enthalpy when a very small amount of pure solute is added to a large amount of either solution or pure solvent. In the latter instance, the resultant quantity which is properly identified as the *partial heat of solution at infinite dilution* is sometimes referred to more simply as the heat of solution. For polymer solutions, $\overline{\Delta H_2}$ is often expressed as the heat absorbed per unit mass of solute added and can be found as the derivative of the integral heat of mixing:

$$\overline{\Delta H_2} = (\partial \Delta H_{\text{mix}}/\partial m_2)_{T,p,n_1} \quad \text{(A2)}$$

Here m_2 is the mass of polymeric solute. Values of $\overline{\Delta H_2}$ at infinite dilution for some polymer–solvent systems are listed in "Heats of Solution of Some Common Polymers".

The *partial or differential heat of dilution* $\overline{\Delta H_1}$ differs from $\overline{\Delta H_2}$ in that it is a consequence of adding solvent, rather than solute, to a solution and is almost always expressed as the heat per mol of added solvent. Accordingly,

$$\overline{\Delta H_1} = (\partial \Delta H_{\text{mix}}/\partial n_1)_{T,p,m_2} = (\partial H_{\text{soln}}/\partial n_1)_{T,p,m_2} - H_1^0 \quad \text{(A3)}$$

It can also be obtained from the variation with concentration of the integral heat of dilution. Or it may be determined from the temperature dependence of the activity a_1 of solvent according to the Gibbs–Helmholtz equation

$$\Delta H_1 = \text{R}[\partial \ln a_1/\partial(1/T)]_{p,n_1,m_2} \quad \text{(A4)}$$

I turn, the activity a_1 of solvent in a polymer solution has a variety of sources including the osmotic pressure of the solution, the vapor pressure of solvent above the solution relative to that of the pure solvent, the gas-chromatographic retention volumes of volatile solvent on columns with polymeric solute as the stationary phase, swelling equilibria for polymer networks, the concentration dependence of Rayleigh scattering, and sedimentation equilibria. The first three methods are the ones used most frequently.

Entropy The entropy of mixing pure polymer with pure solvent can be obtained from the difference between the integral heat of mixing and the free energy of mixing

$$\Delta S_{\text{mix}} = (\Delta H_{\text{mix}} - \Delta G_{\text{mix}})/T \quad \text{(A5)}$$

Free energies of mixing can be determined by integrating concentration-dependent functions of the chemical potential of the solvent.

More often, the partial molar entropy of solvent

$$(\partial \Delta S_{\text{mix}}/\partial n_1)_{T,p,m_2} = \overline{\Delta S_1} \quad \text{(A6)}$$

is reported, using the temperature dependence of the activity of solvent

$$\overline{\Delta S_1} = -R[\ln a_1 + (\partial \ln a_1/\partial T)_{p,n_1,m_2}] \quad \text{(A7)}$$

Volume Volume changes reported in the literature cited below are measured directly (dilatometry) or from density determinations.

B. KEY FOR THE TABLES

The following abbreviations are used to identify the experimental methods utilized for the studies cited:

CD	Calorimetry: integral heat of dilution
CM	Calorimetry: integral heat of mixing
D	Density
DL	Dilatometry
GC	Gas chromatography with polymeric stationary phase
LS	Rayleigh light scattering
OS	Osmotic pressure
SD	Sedimentation equilibrium
SW	Swelling of polymer network
VP	Vapor pressure including manometry, isopiestic distillation, vapor phase osmometry, etc.
XS	X-ray scattering

A Chemical Abstracts Service registry number accompanies most of the polymers named in the table. Although some polymers have more than one registry number owing to particular stereochemistries, different terminal groups, etc., only the most common number appears in the table for each polymer.

Heats of Solution of Some Common Polymers

Robert A. Orwoll
College of William and Mary, Williamsburg, VA, USA

A. Introduction VII-671
B. Table of Heats of Solution VII-671
C. References VII-673

A. INTRODUCTION

Heats of solution (at infinite dilution) are tabulated below for some common polymers dissolved in some common solvents. The values were determined calorimetrically and are reported here as the heat (in Joules) absorbed per gram of polymer as pure polymer and a large excess of pure solvent mixed isothermally to form a homogeneous solution.

The state of the polymer before dissolution is indicated in the fourth column. It can significantly affect the heat of solution. An amorphous polymer below its glass transition temperature (G) often dissolves with release of heat. The heat of solution for a glass is usually dependent on temperature and, to some extent, on the thermal history of the glass. The dissolving of a semicrystalline polymer (C) requires an additional amount of heat associated with the disordering of crystalline regions. Consequently its heat of solution is usually positive and depends on the extent of crystallinity of the sample. An amorphous polymer above its glass transition temperature (L) usually dissolves with the absorption of a small amount of heat but may also dissolve with the release of heat.

Most of the references to measurements made before 1972 were collected by D. R. Cooper (Manchester) for the second edition of this Handbook. A more complete listing of references to heats of solution can be found in the chapter "Heat, Entropy, and Volume Changes for Polymer–Liquid Systems."

B. TABLE OF HEATS OF SOLUTION

Solvent	ΔH (J/g)	Temp. (°C)	State	MW $\times 10^{-4}$ (g/mol)	Refs.
Poly(butadiene)					
Benzene	13	27	L	8	5
Cyclohexane	5.4	25	L	–	23
n-Hexadecane	4.9	25	L	–	24
Poly(dimethyl siloxane)					
Benzene	14	25	L	10	11
Carbon tetrachloride	2.4	25	L	10	11
Cyclohexane	5.1	25	L	10	11

A. INTRODUCTION

Applications of solubility parameters include selecting compatible solvents for coating resins, predicting the swelling of cured elastomers by solvents, estimating solvent vapor pressure in polymer solutions for devolatilization and reaction systems (16), and predicting phase equilibria for polymer–polymer (107), polymer–binary (93), random copolymer (102), and multicomponent solvents (38, 98,108,109).

Cohesive energy density and solubility parameters are defined in the section on miscibility of solvents and polymers (Section B). In addition, the applicability of solubility parameters to thermodynamic calculations and their limitations are discussed. Section C contains methods for measuring, calculating and correlating solubility parameters of solvents and polymers. Section D contains

alphabetical listings of solubility parameters (Table 7), a list of solubility parameters in rank order (Table 8), a list of three-component solubility parameters of solvents (Table 9), and a list of solubility parameters of polymers (Table 10). With the exception of Table 7, solubility parameter values are reported in $MPa^{1/2}$ units. The table showing solubility parameter value ranges for polymers (Table 3.4 in the third edition) has not been reproduced here.

B. MISCIBILITY OF SOLVENTS AND POLYMERS

1. Cohesive Energy Density and the Solubility (Hildebrand) Parameter

Dissolution of an amorphous polymer in a solvent is governed by the free energy of mixing

$$\Delta G_m = \Delta H_m - T\Delta S_m \tag{B1}$$

where ΔG_m is the Gibbs free energy change on mixing, ΔH_m is the enthalpy change on mixing, T the absolute temperature, and ΔS_m is the entropy change on mixing. A negative value of the free energy change on mixing means that the mixing process will occur spontaneously. Otherwise, two or more phases result from the mixing process. Since the dissolution of a high molecular weight polymer is always connected with a small or modest increase in entropy, the enthalpy term (the sign and magnitude of ΔH_m) is the deciding factor in determining the sign of the Gibbs free energy change. Solubility parameters were developed to describe the enthalpy of mixing of simple liquids (nonpolar, nonassociating solvents), but have been extended to polar solvents and polymers.

Hildebrand and Scott (59) and Scatchard (101) proposed that

$$\Delta H_m = V\left(\left(\frac{\Delta E_1^v}{V_1}\right)^{1/2} - \left(\frac{\Delta E_2^v}{V_2}\right)^{1/2}\right)^2 \phi_1\phi_2 \tag{B2}$$

where V is the volume of the mixture, ΔE_i^v the energy of vaporization of species i, V_i the molar volume of species i, and ϕ_i the volume fraction of i in the mixture. ΔE_i^v is the energy change upon isothermal vaporization of the saturated liquid to the ideal gas state at infinite volume (94). The cohesive energy density (CED), ΔE_i^v, is the energy of vaporization per cm^3. The solubility parameter has been defined as the square root of the cohesive energy density and describes the attractive strength between molecules of the material.

$$\delta_i = \left(\frac{\Delta E_i^v}{V_i}\right)^{1/2} \tag{B3}$$

The dimensions of δ_i are

$$\begin{aligned}(\mathrm{cal/cm^3})^{1/2} &= (4.187\,\mathrm{J}/10^{-6}\,\mathrm{m^3})^{1/2} \\ &= 2.046\times 10^3(\mathrm{J/m^3})^{1/2} = 2.046\,\mathrm{MPa}^{1/2}\end{aligned} \tag{B4}$$

The solubility parameter can be interpreted as the "internal pressure" of the solvent (9–11). δ_i is called the Hildebrand parameter by some authors. Other researchers (13) prefer the term, "cohesion parameter", since it correlates with a large number of physical and chemical properties, and not just the miscibility of the components. The solubility parameter of a mixture is often taken as the sum of the products of the component solubility parameters with their volume fractions:

$$\delta_{\text{mixture}} = \sum_i \delta_i\phi_i \tag{B5}$$

Relation between δ_i and ΔH_m Equation (B2) can be rewritten to give the heat of mixing per unit volume for a binary mixture:

$$\frac{\Delta H_m}{V} = (\delta_1 - \delta_2)^2\phi_1\phi_2 \tag{B6}$$

Equation (B6) gives the heat of mixing of regular solutions in which the components mix with: (a) no volume change on mixing at constant pressure, (b) no reaction between the components, and (c) no complex formation or special associations (114). The heat of mixing must be smaller than the entropic term in Eq. (B1) for polymer–solvent miscibility ($\Delta G_m \le 0$). When $\delta_1 = \delta_2$, the free energy of mixing will always be less than zero for regular solutions and the components will be miscible in all proportions. In general, the solubility parameter difference, $(\delta_1 - \delta_2)$ must be small for miscibility over the entire volume fraction range.

Relation between δ_i and ΔH_i^v The energy change on isothermal vaporization can be related to the enthalpy of vaporization:

$$\Delta E_i^v = \Delta H_i^v + \Delta H_i^\infty - RT + p_i^s V_i \tag{B7}$$

where ΔH_i^v is the enthalpy of vaporization at standard conditions, ΔH_i^∞ the molar increase in enthalpy on isothermally expanding the saturated vapor to zero pressure, R the ideal gas constant, and p^s the saturation vapor pressure at temperature, T. At pressures below 1 atm, the ΔH_i^∞ and $p^s V_i$ terms are usually much less than the ΔH_i^v and RT terms, and Eq. (B7) reduces to Eq. (B8):

$$\Delta E_i^v = \Delta H_i^v - RT \tag{B8}$$

The solubility parameter of volatile materials (solvents for example) can be determined by measuring their enthalpy of vaporization or using a correlation for this quantity, and using Eq. (B9):

$$\delta_i = \left(\frac{\Delta H_i^v - RT}{V_i}\right)^{1/2} \tag{B9}$$

Equation (B9) should be used at pressures near 1 atm. Near the critical point, $\Delta H_i^v = 0$, and Eq. (B8) incorrectly

predicts a negative value for the cohesive energy density while Eq. (B7) yields a small positive value.

Dissolution of crystalline polymers The free energy of mixing for crystalline polymers contains terms for the free energy of fusion for the crystalline volume fraction of the material. The free energy of fusion may contain terms that account for the loss of crystallite surface area and the mixing of amorphous material with oriented material. These terms would be added to Eq. (B1). The enthalpy of mixing could still be modeled using Eqs. (B2) or (B6). Some crystalline polymers obey the solubility parameter model at temperatures near their melting point, $T > 0.9T_m$ (123). Solvent swelling experiments with crystalline polymers may fit Eq. (B1), particularly if the solvent is a poor one for the polymer and does not significantly dissolve crystalline regions.

2. Cohesive Energy Parameters for Polar Systems

The solubility parameter describes well the enthalpy change on mixing of nonpolar solvents but does not always give reliable results when extended to polar systems. The free energy change of mixing for polar systems is dominated by hydrogen-bonding forces between various groups in the solvent and polymer. Hydrogen-bonding forces are much stronger than van der Waals or dipole forces and often dominate the free energy of mixing. Complete miscibility is expected to occur if the solubility parameters are similar and the degree of hydrogen bonding (p: poor, m: moderate and s: strong) is similar between the components. Hydrocarbons, chlorinated hydrocarbons and nitrohydrocarbons are considered to be poor hydrogen-bonding solvents. Ketones, esters, and glycol monoethers give moderate hydrogen bonding. Alcohols, amines, acids, amides and aldehydes are strong hydrogen-bonding solvents. Table 7 classifies materials using these categories (21–24). Alternative classifications have been given by Lieberman (69), Gardon (41,85,86) and Dyck and Hoyer (32).

Other investigators have decomposed the Hildebrand parameter into several terms representing different contributions to the free energy of mixing. Hildebrand (59) used dispersive and polar solubility terms for solvents, with the complete parameter being given by

$$\delta^2 = \delta_d^2 + \delta_p^2 \tag{B10}$$

where δ_d is the dispersive term and δ_p the polar term. The additional term improved agreement between δ and experimental data. Prausnitz and coworkers accounted for polar bonding by including parameters for permanent dipole interactions and dispersion type interactions. This approach has been applied to polymer solutions (15) and complex formation (57). Crowley et al. (26,27) proposed a three-parameter system.

Hansen (49–53,56) and Hansen and Skaarup (54) assume that the cohesive energy arises from dispersive, permanent dipole–dipole interactions and hydrogen bonding forces:

$$\delta^2 = \delta_d^2 + \delta_p^2 + \delta_h^2 \tag{B11}$$

where δ_h accounts for a variety of association bonds, including hydrogen bonds and permanent dipole-induced dipole (47). The values of these components for solvents were calculated from a large number of solubility data sets. Polymer solubility parameters can also be decomposed to a three-term set. The Hansen parameters give improved agreement with data but are still not completely accurate in predicting solutions thermodynamics for every system. Peiffer (172) has related dispersion, polar and induced solubility parameters to intermolecular forces and molecular size. The dispersive component increases with molecular size, while the polar component decreases with molecular size.

Temperature effects The solubility parameter decreases with temperature. The individual terms have varied dependence on temperature, namely (Ref. 55)

$$\begin{aligned} \frac{d\delta_d}{dT} &= -1.25 \times \alpha \times \delta_d \\ \frac{d\delta_p}{dT} &= -\frac{\delta_p \times \alpha}{2} \\ \frac{d\delta_p}{dT} &= -\delta_h\left(1.22 \times 10^{-3} + \frac{\alpha}{2}\right) \end{aligned} \tag{B12}$$

where $\alpha(K^{-1})$ is the volumetric thermal expansion coefficient.

3. Relationship between Solubility Parameters and other Thermodynamic Parameters

Hildebrand and Hansen parameters can be calculated using other thermodynamic quantities. This section contains some of the relationships for binary systems. Extensions to multicomponent systems are described by Flory (37) and Olabisi et al. (89).

Activity coefficients Excess free energy calculations for regular solutions (93) can be used to relate solubility parameters and solvent activity coefficients:

$$RT \ln\gamma_1 = V_1\phi_2^2(\delta_1 - \delta_2)^2 \tag{B13}$$

$$RT \ln\gamma_2 = V_2\phi_1^2(\delta_1 - \delta_2)^2 \tag{B14}$$

where γ_i is the activity coefficient of component i. Equations (B13) and (B14) depend on the use of the geometric mean, $\delta_{12} = (\delta_1 \times \delta_2)^{1/2}$. Funk and Prausnitz (40) show that there are deviations from this rule for aromatic hydrocarbons.

Molar excess free energy of mixing The molar excess free energy of mixing for binary solutions is

$$\Delta G^E = \sum_i (\delta_{1-i} - \delta_{2-i})^2 \tag{B15}$$

where δ_{j-i} is the solubility term of group i for species j.

References page VII-711

Polymer–solvent interaction parameter The polymer–solvent interaction parameter, χ, is modeled as the sum of entropic and enthalpic components:

$$\chi = \chi_H + \chi_S \quad \text{(B16)}$$

where χ_H is the enthalpic component and χ_S is the entropic component. χ_S is usually taken to be a constant between 0.3 and 0.4 for nonpolar systems: $\chi_S = 0.34$ is often used (15,104). The enthalpic component can be related to the Hildebrand parameters:

$$\chi_H = \frac{V_1}{RT}(\delta_1 - \delta_2)^2 \quad \text{(B17)}$$

Substituting Eq. (B17) into Eq. (B16)

$$\chi = \frac{V_1}{RT}(\delta_1 - \delta_2)^2 + 0.34 \quad \text{(B18)}$$

Equation (B18) permits only positive values of the interaction parameter. Since the Flory–Huggins criterion for complete solvent–polymer miscibility is $\chi < 0.5$, the enthalpic contribution must be small and the solubility parameters of the solvent and polymer must be similar (21). The molar volume of the solvent also affects miscibility and phase equilibria: a Hildebrand parameter needed for phase separation or miscibility cannot be specified without specifying V_1.

Interchange energy density Equation (B18) works well for nonpolar systems for which Eq. (B17) is a good description of the enthalpic component of the interaction parameter. The geometric mean assumption of regular solution theory is not appropriate for polar systems, and better models include an extra term describing the interchange energy density for the solvent–polymer pair. For example

$$\chi = \chi_S + \frac{V_1 A_{12}}{RT} \quad \text{(B19)}$$

with

$$A_{12} = \delta_1^2 + \delta_2^2 - 2 \times l_{12}\delta_1\delta_2 \quad \text{(B20)}$$

where l_{12} characterizes the intermolecular forces between molecules (rather than using the geometric mean assumption). Equation (B20) allows the modeling of specific interactions between components 1 and 2. Mixed solvents can be treated as a single solvent by determining the solubility parameter of the solvent mixture, and then using this value in Eq. (B18). If both the solvents and the polymers interact, the description is more complicated. An alternative definition of A_{12} uses the two-component solubility parameter (Ref. 25)

$$A_{12} = (\delta_{1d} - \delta_{2d})^2 + (\delta_{1p} - \delta_{2p})^2 \quad \text{(B21)}$$

The Hansen parameters may also be used to model A_{12}.

Several recent theories for polymer solution thermodynamics include entropic, enthalpic and free-volume contributions to the free energy of mixing. The free-volume contributions modify the entropic components, and have the opposite temperature dependence from the combinatorial term, helping to explain the lower critical solution temperature. Since Eq. (B18) assumes a constant value for the entropic component, it may not be valid over large temperature ranges. However, Eq. (B18) will predict the upper critical solution temperature, and, from this standpoint, is adequate for a number of phase equilibria applications near this condition.

The Lattice Fluid model (170) can be used to predict the solubilities of hydrocarbon and chlorinated hydrocarbons in nonpolar polymers. Three-dimensional solubility parameters can be used to provide an empirical correction to the geometric mean approximation (171). This correction predicts the solubility of polar and nonpolar solvents in polymers using only the pure component equation-of-state and solubility parameters.

Guide to polymer–solvent miscibility A region of solubility has been characterized by the distance between solvent and solute coordinates (Ref. 14)

$$R_{ij} = \left(4(\delta_{1d} - \delta_{2d})^2 + (\delta_{1p} - \delta_{2p})^2 + (\delta_{1h} - \delta_{2h})^2\right)^{1/2} \quad \text{(B22)}$$

A more general definition of the region of solubility is

$$R_{ij} = \delta_1 - \delta_2 = (a(\delta_{1d} - \delta_{2d})^2 + b(\delta_{1p} - \delta_{2p})^2 + b(\delta_{1h} - \delta_{2h})^2)^{1/2} \quad \text{(B23)}$$

where a and b are empirical weighing factors. If the distance between the solvent and the solute Hansen coordinate position exceeds R_{ij}, the two components are not soluble, or swelling is less than expected. R_{ij} reduces the need for three-dimensional plots. Some investigators have used two-dimensional plots for polar and hydrogen bonding terms, but the technique may be misleading for materials with large dispersion contributions. Barton (12) gives a number of models and contour map examples. As mentioned previously, Eqs. (B17)–(B19) suggest that the solvent molar volume can have a significant effect on miscibility.

Zeller (131) reviewed graphical three-dimensional solubility parameter estimation methods (12,14,49,55,172,173) as applied to solvent swelling of crosslinked elastomers. In general, the graphical method (Eqs. B22 and B23) does not account for the known influence of molar volume and crosslink density of solubility, and incorrectly assumes a linear relationship between the solubility parameter difference and solubility. An improved method used the Flory–Rehner equation to modify the interaction parameter for the effects of crosslink density (132).

Guide to polymer–polymer miscibility In many polymer–polymer systems, miscibility can be predicted by comparing the solubility parameters (139). The following table proposes misciblity guidelines. Polymer–polymer miscibility is enhanced when hydrogen bonding is present.

TABLE OF MISCIBILITY GUIDELINES[a]

Intermolecular interaction	Polymer blend example	Critical value of the interaction parameter, χ_{crit}	Upper limit of the non-hydrogen bonded solubility parameter difference, $\Delta\delta$ ($MPa^{1/2}$)
Dispersive forces only	Polyisoprene–Poly-(vinylethylene)	<0.002	<0.02
Dipole–dipole interactions	Poly(methyl methyacrylate)–poly(ethylene oxide)	0.002–0.001	0.2–1.0
Weak hydrogen bonds	Poly(vinyl chloride)–polycaprolactone	0.02–0.2	1.0–2.0
Moderate hydrogen bonds	Poly(vinyl phenol)–poly(vinyl acetate)	0.2–1.0	2.0–5.0
Strong hydrogen bonds	Poly(vinyl phenol)–poly(vinyl methyl ether	1.0–1.5	5.0–6.0

C. SOLUBILITY PARAMETER MEASUREMENTS, CALCULATIONS, AND CORRELATIONS

Solubility parameters can be determined by direct measurements, indirect calculations, or correlations with other physical parameters. The solubility parameters of solvents usually can be determined directly by measuring the energy of vaporization. The solubility parameters of polymers can only be determined indirectly and may be affected by variations in their chemical constitutions, i.e., the number of crosslinks and the distribution of chain branches or substitutive groups along the polymer backbone. The methods presented in this section can be used to develop correlations of solubility parameters with other physical properties for specific commercial polymer products or to estimate the solubility parameters of new polymers.

1. Solvents

Calculation of the solubility term (δ) by relating the enthalpy of vaporization to the energy of vaporization Equation (B8) can be used to calculate ΔE_i^v when ΔH_i^v is available. The molar volume of the solute is needed to complete the calculation of δ, using Eq. (B3). This is the most direct and accurate method of determining the solubility parameter. However, δ's determined in this way may not give the best prediction of solution behavior. The solubility parameter values in Tables 7–9 reflect the solvent's behavior in a variety of systems.

Correlations Both the enthalpy of vaporization and the molar volume of a solvent can be estimated from correlations. When ΔH_i^v is known at the normal boiling point, it can be converted to the appropriate value at a second temperature using (126)

$$\frac{\Delta H_i^v(T_2)}{\Delta H_i^v(T_1)} = \left(\frac{T_c - T_2}{T_c - I_1}\right)^{0.38} \quad \text{(C1)}$$

This corresponding state-type procedure gives estimates within 2% of experimental values over a wide range of temperatures (13). Hildebrand and Scott (59) proposed an empirical correlation between ΔH_i^v at 25°C and the normal boiling point, T_b:

$$\Delta H_i^v(298K) = 0.2950 + 23.6T_b + 0.020T_b^2 \quad \text{(C2)}$$

with enthalpy units of kcal/mol. Lawson (67) suggests different coefficients to include fluorocarbon liquids. The Clausius–Clapeyron equation can be applied if vapor pressure data are available. Eq. (C2) is reasonably accurate only for liquids that are not hydrogen bonded. The Hildebrand parameter calculated by Eq. (C2) should be adjusted as follows for different solvents (24): add 1.4 $(cal/cm^3)^{1/2}$ for alcohols, add 0.6 $(cal/cm^3)^{1/2}$ for esters, and add 0.5 $(cal/cm^3)^{1/2}$ for ketones if the boiling point is less than 100°C. Jayasri and Yaseen (64) suggest adding 1.7 $(cal/cm^3)^{1/2}$ for alcohols.

Solvent molar volumes are available or can be calculated by group molar volume methods at 25°C (35,163–165). The molar volume for solids at 25°C can be extrapolated from liquid state values (the liquid is assumed to be subcooled).

Thermodynamic coefficients The internal pressure, π, is defined as (Ref. 88)

$$\pi = \frac{\partial E}{\partial V} = T\beta - P \quad \text{(C3)}$$

where β is the constant volume thermal pressure coefficient (the ratio of the coefficient of thermal expansion, α, to the isothermal compressibility, κ). Since the external pressure is usually small with respect to $T\beta$, the internal pressure is approximated by

$$\pi = T\beta = T\frac{\alpha}{\kappa} = T\left(\frac{\partial P}{\partial T}\right) \quad \text{(C4)}$$

The Hildebrand parameter is the square root of the internal pressure. Eq. (C4) provides a method for scaling the Hildebrand parameter with temperature. This equation also provides a method for the direct estimation for δ of polymers; α and κ are measurable when ΔH_i^v is not meaningful (B7). The thermal pressure coefficient (C4) can be evaluated from vapor-pressure data and is easier to apply than the Clausius–Clapeyron equation. For high pressure applications, such as phase equilibria in reverse osmosis membranes, the external pressure term in Eq. (C3) may not be negligible. Solubility parameters generally decrease with increasing pressure.

References page VII-711

van der Waals gas constant Tables are available in many Handbooks for the van der Waals correction constants to the ideal gas law, a and b, where a has units of l^2/atm. For some liquids, these values may be at hand when other data are not available. They can be used to check Hildebrand parameter values obtained from other sources.

$$\delta = 1.2\frac{\sqrt{a}}{V} \tag{C5}$$

The form of Eq. (C5) can be obtained by substituting the van der Waals equation of state into Eq. (C3).

Critical pressure The solubility parameter is related to the critical pressure, P_c of a substance through the empirical equation

$$\delta = 1.25\,P_c^{1/2} \tag{C6}$$

where the critical pressure is expressed in atmospheres. Equation (C6) is not very accurate, but is simple to apply when critical pressure data are available.

Surface tension Michaels (83) has shown that the surface tension can be related to the cohesive energy density:

$$\frac{\Delta E_i^{v}}{V_i} = A\left(\frac{1}{V_i}\right)^{1/3}\gamma_L \tag{C7}$$

where γ_L is the surface tension and A is a constant. Koenhen and Smolders (65) correlated surface tension and two Hansen parameters:

$$\delta_d^2 + \delta_p^2 = 13.8\left(\frac{1}{V_i}\right)^{1/3}\gamma_L \tag{C8}$$

δ_h is probably not related to the liquid–vapor interfacial energy as these interactions do not involve breaking hydrogen bonds. Eq. (C8) does not describe cyclic compound, acetonitrile, carboxylic acids, polyfunctional alcohols, and other polar compounds well. Hildebrand and Scott (59) have proposed a different equation, which has been discussed by Lee (68).

Index of refraction The dispersive Hansen parameter can be related to the index of refraction, n_D (65,105).

$$\delta_d = 9.55\,n_D - 5.55 \tag{C9}$$

The interaction energy between nonpolar molecules should depend on polarizability (London dispersion forces) and, therefore, on the index of refraction.

Dipole moment Hansen and Skaarup (54) related the polar Hansen parameter to the dielectric constant, ε, and the dipole moment, μ:

$$\delta_p^2 = \frac{12108}{V^2}\frac{\varepsilon - 1}{2\varepsilon + n_D^2}(n_D^2 + 2)\mu^2 \tag{C10}$$

Beerbower and Dicky (14) proposed an empirical relationship:

$$\delta_p^2 = 9.5\frac{\mu}{V_i^{1/2}} \tag{C11}$$

Kauri butanol values Proprietary hydrocarbon solvents are usually mixtures with boiling ranges and unknown molecular weights. Solubility parameter values may be estimated from Kauri butanol values (ASTM Method D1133-54T) using the equation

$$\delta = 6.3 + 0.03\,\mathrm{KB} \tag{C12}$$

2. Polymers

Hildebrand parameters cannot be calculated for polymers from heat of vaporization data because of their nonvolatility. Indirect methods are described below. The solubility parameter values in Table 10 may only be representative of a given polymer since variations in compositions can lead to changes in δ.

2.1. Indirect Measurements

Solvency testing (screening procedure) The classic method for determining solubility parameter of a commercial polymer is solvency testing, or the solvency screening procedure. This technique compares polymer solubility in solvent groups with different hydrogen bonding characteristics (poor, moderate and strong). The midpoints of the polymer's solubility range may be used as single-valued quantities for some purposes, but may not agree with values determined by other methods (43). A gram or two of solid polymer is placed in a test tube and an approximate amount of a selected solvent is added such that the final solution would have about the correct solid content for the expected commercial use, e.g., 50% for alkyds, 20% for vinyls, etc. The exact amount is often unimportant, except for poor solvents. A typical phase diagram for binary polymer–solvent systems may show upper and lower critical solution temperatures. The one-phase region expands away from the UCST and LCST points, which often occur in the range of 20–80 wt.% polymer. The usual purpose of these experiments is to find good solvents for commercial product formulation, and this screening procedure will help identify such solvents. The mixture may be warmed and stirred to speed up solution, but it should be cooled and observed at room temperature. The resulting mixture should be a single phase, clear and free of gel particles or cloudiness, otherwise the polymer is judged insoluble. The solvents to be used are selected from Table 1.

This grouping of solvents has been selected so that the Hildebrand parameter values increase by reasonably constant steps within each hydrogen bonding class. The object of using these solvent spectra is to establish a solubility parameter range for a polymer rather than a single-valued number. This range has the advantage of showing the difference, $(\delta_1 - \delta_2)^2$ (see Eqs. B13, B14 and

B18), which can be tolerated between the solubility values of the polymer and solvent for miscibility. Van Dyk et al. (120) have shown that the molar volume improves the correlation between solvency and the solubility parameters. A better measure of solubility might be the group, $V_1(\delta_1 - \delta_2)^2$.

In carrying out the procedure, it is convenient to select the first trials about 1/2 and 2/3 of the way down the column; for example, in the poorly hydrogen bonded group, toluene and nitroethane would be chosen. If the polymer is soluble in both, there is no need to try intermediate solvents because experience has shown that the polymer will be soluble in every case. The solvents at the end of the spectrum should be tried next. If the polymer is soluble in one but not both of the initial trials, the third trial should be half-way between the two. By successive choices, sets of two adjacent solvents will be found, one of which dissolves the polymer and one that does not. The parameter values of the solvents which do dissolve the polymer mark the ends of the range. The procedure is repeated for the other two hydrogen bonding classes.

Osmotic pressure Fedors (35) used the osmotic pressure of polymer solutions to determine solubility parameters.

Swelling values Another method for measuring the solubility parameter of polymers is to prepare a sparsely crosslinked sample and immerse it in a series of liquids of varying δ (166,167). The crosslinked material will swell to varying degrees, with the maximum amount of swelling occurring when the solvent has the same Hildebrand parameter as the polymer. The amount of swelling can be measured by length, weight, or volume changes. By inference, the soluble, uncrosslinked materials has the same value. An example of a crosslinked sample is styrene polymerized with 1% divinyl benzene.

Turbidity Polymer can be precipitated from dilute solution by adding a non-solvent. The cloud point defines the onset of two phases. The enthalpic component of the interaction parameter, χ_H, can be related to the solubility parameter difference between the solvent and the polymer (Eq. B17). Two different non-solvents are used: one having a solubility parameter above that of the solvent, and another having a solubility parameter below that of the solvent. The enthalpic components of the interaction parameter for each phase are equal at the cloud point, which can be used to measure the solubility parameter of the polymer (116). The two expressions for χ_H are

$$\frac{V_{\text{ml}}(\delta_2 - \delta_{\text{ml}})^2}{RT} = \frac{V_{\text{mh}}(\delta_2 - \delta_{\text{mh}})^2}{RT} \tag{C13}$$

where V_{ml} and V_{mh} represent the molar volumes at the cloud points of the solvent-lower solubility parameter nonsolvent and solvent-higher solubility parameter non-solvent, respectively. δ_{ml} and δ_{mh} are the solubility parameters of the mixed solvents. The mixture properties are calculated using

$$\delta_{\text{m}} = \phi_1\delta_1 + \phi_3\delta_3 \tag{C14}$$

$$V_{\text{m}} = \frac{V_1 V_3}{\phi_1 V_3 + \phi_3 V_1} \tag{C15}$$

where the subscripts, 1 and 3, refer to the solvent and the nonsolvent. Eq. (C13) is simplified to determine the solubility parameter of the polymer:

$$\delta_2 = \frac{(\sqrt{V_{\text{ml}}}\delta_{\text{ml}} + \sqrt{V_{\text{mh}}}\delta_{\text{mh}})}{(\sqrt{V_{\text{ml}}} + \sqrt{V_{\text{mh}}})} \tag{C16}$$

The volume fraction of the nonsolvent at the cloud point is used to compute the solvent mixture solubility parameter and molar volume. Cloud point experiments are done for a series of solvents with the two nonsolvents, generating a set of points, (δ_1, δ_2). The intersection of the line defined by this set of points with the line, $\delta_1 = \delta_2$, determines the polymer's solubility parameter.

Specific volume The specific volume of polymers varies with the solvent. Good solvents give higher values of the specific volume while poor solvents give lower values. A plot of the polymer specific volume as a function of solubility parameter gives a maximum value, which is taken to be the solubility parameter of the polymer. High precision density measurements at carefully controlled temperatures are needed for this method (168). The partial specific volume is defined as

$$\bar{V}_i = \left.\frac{\partial V}{\partial c_i}\right|_{T,p,i \neq j} \tag{C17}$$

The specific volume of a nonideal two-component system is

$$V_{\text{spec}} = \phi_1\bar{V}_1 + \phi_2\bar{V}_2 \tag{C18}$$

where $\bar{V}_2$ is the rate of change in volume of the solution when a very small amount of polymer is added. As the solvent volume fraction goes to one, the partial molar volume of solvent is constant and Eq. (C18) becomes

$$V_{\text{spec}} = \bar{V}_{1(c_2=0)} + \phi_2\bar{V}_2 \tag{C19}$$

The maximum of the polymer partial specific volume is estimated by fitting a quadratic to the data (Ref. 142):

$$\bar{V}_2 = \bar{V}_{2,\max} - A(\delta_1 - \delta_2)^2 \tag{C20}$$

It is possible to estimate the polymer solubility parameter with only two reference solvents (168), but more reliable values are found by using a range of solvents.

Intrinsic viscosity A number of researchers have used intrinsic viscosity to estimate Hildebrand parameters (74).

Flory (37) related intrinsic viscosity to polymer molecular weight and the chain-expansion factor. The chain-expansion factor can, in turn, be related to the polymer–solvent interaction parameter using the Flory–Huggins theory. Maximum coil extension should occur in solvents near the polymer's solubility parameter. A variety of models can be used to relate the interaction parameter to Hildebrand parameters (19,80,115,167–169). These equations are quadratic (Eq. C21) or take the form of a gaussian curve (Eq. C22):

$$[\eta] = [\eta]_{\max} - A(\delta_1 - \delta_2)^2 \qquad \text{(C21)}$$

$$[\eta] = [\eta]_{\max}\exp(-A(\delta_1 - \delta_2)^2) \qquad \text{(C22)}$$

where $[\eta]$ is the intrinsic viscosity, $[\eta]_{\max}$ the maximum intrinsic viscosity, and A the constant. These researchers have shown that Eq. (C14) gives a good correlation between solvency and Hansen parameters for methacrylate polymers.

Inverse phase gas chromatography This method has been used by a number of investigators to measure infinite dilution weight fraction activity coefficients (6,29–31,63,71,72,84,90,91,113). These coefficients can be related to Hildebrand parameters by using a thermodynamic theory for polymer solutions, such as Flory–Huggins theory. The polymer is the stationary phase in a gas chromatography column. Both binary and multicomponent equilibria (46,99,100) can be studied using this method. Chromatographic techniques have the advantage of rapid measurement of thermodynamic values once the columns have been made. The solubility parameter can be related to the specific retention volume of the solvent on the column. Both V_i and ΔH_i^{v} must be known at the temperature of the column. Molar volumes for the solvents can be determined by using literature density equations or generating equations from density data. Values for the enthalpy of vaporization can be determined at the experimental temperature (71).

The inverse phase gas chromatography method has the advantage of providing values for the infinite dilution solubility parameter, δ_i^{∞}, over a range of temperatures. This is particularly valuable for the prediction of phase equilibria at elevated temperatures. The value of δ_i^{∞} at 25°C can be estimated by using the expected temperature dependence for χ (Eq. B18) of

$$\chi = \alpha + \frac{\beta}{T} \qquad \text{(C23)}$$

One potential problem with this technique is that χ is known to be a function of concentration and the polymer Hildebrand parameter is determined at infinite dilution of solvent. For a number of binary systems, the change in χ with solvent weight fraction is the largest as $\omega \to 0$. The concentration dependence of the interaction parameter can be modeled using methods given in the chapter on interaction parameters in this Handbook.

2.2. Correlation Methods

Refractive index Koenhen and Smolders (65) have predicted dispersive Hansen parameters from refractive index measurements of polymers. Wu (128) has suggested an effective cross-sectional area to relate the cohesive energy density and surface tension

$$\delta_{\text{d}}^2 = A\left(\frac{n_{\text{s}}}{V_{i,\text{s}}}\right)^{1/3} \gamma_{\text{s}}^{\text{d}} \qquad \text{(C24)}$$

where n_{s} is the number of atoms in a segment, $V_{i,\text{s}}$ the molar volume of a segment, and $\gamma_{\text{s}}^{\text{d}}$ the dispersion contribution to the free surface energy of the polymer.

Dipole moment Equation (C10) has been applied to polymers by Koenhen and Smolders (65). The dipole moments of polymers are between 70% and 90% of those of the corresponding monomer units.

Hydrogen-bonding parameter Hansen and Beerbower (55) compiled enthalpy data for hydrogen bonding groups. The following values are suggested:

Group	Cohesive energy, E_{h}, (kJ/mol)	Refs.
Alcohol	20.9	–
Amide	16.3	83
Ester	5.2	54
Nitrile	2.1	54
Ether	2.3	54
Monochloro substituent	0.4	54
Phenylene ring	0.4	54

The hydrogen-bonding parameter is given by

$$\delta_{\text{h}}^2 = \frac{E_{\text{h}}}{V_i} \qquad \text{(C25)}$$

Group contribution methods These methods have been used to estimate the solubility parameter (17,20,28,33,35, 58,60,61,96,112,121,122). van Krevelen (123), Fedors (35), and Barton (12) have reviewed these techniques and given tables of group values. The molar volume of solvents and polymers can also be estimated by group contribution techniques (108).

The sets of group constants of Small (112), Hoy (61) van Krevelen (121) and van Krevelen and Hoftyzer (122) seem to be most comprehensive. Table 2 gives the group molar attraction constants at 25°C. Small's values were derived from measurements of the heat of vaporization. Hoy's values were derived from vapor pressure measurements. The group contribution values of van Krevelen and Hoftyzer are based on cohesive energy data of polymers.

The group contribution techniques are based on the assumption that the contributions of different functional groups to the thermodynamic property are additive. The energy of vaporization of a solvent or polymer is

$$\Delta E_i^{\text{v}} = \sum_j n_j \Delta e_j \qquad \text{(C26)}$$

where Δe_j is the energy of vaporization contribution of group j, and n_j the number of groups of type j in the molecule. The solubility parameter is obtained by combining Eqs. (B3) and (C26):

$$\delta_i = \left(\frac{\Delta E_i^{\mathrm{v}}}{V_i}\right)^{1/2} = \left(\frac{\sum_j n_j \Delta e_j}{V_i}\right)^{1/2} \tag{C27}$$

Small (112) defined the molar attraction constant as

$$F_j = (\Delta E_{i,j}^{\mathrm{v}} V_{i,j})^{1/2} \tag{C28}$$

that can be used to calculate the solubility parameter by

$$\delta_i = \left(\frac{\Delta E_i^{\mathrm{v}} V_i}{V_i^2}\right)^{1/2} = \frac{\sum_j F_j}{V_i} = \frac{\rho_i \sum_j F_j}{M_i} \tag{C29}$$

where ρ_i is the polymer density and M_i is the polymer molecular weight. δ_i can be evaluated for polymer repeating group by using group contribution calculations for the molar volume and the cohesive energy density or molar attraction constant. Table 2 gives sets of molar attraction constants and the energy of vaporization provided by several different authors. It is preferrable to use parameters from only one set when determining the solubility parameter of a repeating unit. Table 3 gives the cohesive energy densities and group molar volumes determined by Fedors. This set may give less accurate estimates than those in Table 2, but it has value because it is more comprehensive and can be applied to more systems.

Hansen parameters The terms in Eq. (B11) can be estimated by group contribution methods. In general, the resulting factors are known less accurately than the group molar attraction constants or energy of vaporizations. The interaction of structural groups within molecules may not follow simple additive rules. However, the estimate of Hansen parameters can be very useful. Under the method of Hoftyzer and van Krevelen (Table 4), the terms are estimated as

$$\delta_{\mathrm{d}} = \frac{\sum F_{\mathrm{d}i}}{V} \qquad \delta_{\mathrm{p}} = \frac{\sqrt{\sum F_{\mathrm{p}i}^2}}{V} \qquad \delta_{\mathrm{h}} = \sqrt{\frac{\sum E_{\mathrm{h}i}}{V}} \tag{C30}$$

The dispersive Hansen parameter treats the molar attraction constants as additive. The polar Hansen parameters also are additive, unless more than one polar group is present. Methods for treating additional polar groups are given in the last three rows of Table 4: additional polar groups do not add linearly to the polar Hansen term. The molar attraction constant is not applied to the hydrogen-bonding Hansen parameter. Rather, a hydrogen bonding energy, $E_{\mathrm{h}i}$, is used.

Hoy (178–179) has an alternative group contribution method (Table 5). It includes a molar attraction function, $F_{t,i}$ a polar component of this function, $F_{\mathrm{p},i}$, the molar volume of the solvent or polymer structural unit, the Lyderson correction for solvent non-ideality, $\Delta_{\mathrm{T},i}$, and a similar correction for polymer non-ideality, $\Delta_{\mathrm{T},i}^{(\mathrm{P})}$.

Bicerano (164) and Porter (165) have developed new group contribution techniques for a wide variety of polymer properties. These approaches consider how the different functional groups are connected in the molecule or in the polymeric repeating unit. Bicerano's method uses Fedor's (35) and van Krevelen's (123,163) group contribution values. Both references provide solubility parameter predictions of a number of polymers.

TABLE 1. SELECTED SOLVENTS FOR USE IN POLYMER SOLVENCY TESTING

Solvent	δ (MPa$^{1/2}$)
POORLY HYDROGEN BONDED	
n-Pentane	14.3
n-Heptane	15.1
Methylcyclohexane	16.0
Solvesso 150	17.4
Toluene	18.2
Tetrahydronaphthalene	19.4
o-Dichlorobenzene	20.5
1-Bromonaphthalene	21.7
Nitroethane	22.7
Acetonitrile	24.1
Nitromethane	26.0
MODERATELY HYDROGEN BONDED	
Diethyl ether	15.2
Diisobutyl ketone	16.0
n-Butyl acetate	17.4
Methyl propionate	18.2
Dibutyl phthalate	19.0
Dioxane	20.3
Dimethyl phthalate	21.9

TABLE 6. EQUATIONS TO BE USED FOR HOY'S SYSTEM[a]

Formulae	Solvents	Amorphous polymers
Additive molar functions	$F_t = \sum n_i F_{t,i}$ $F_p = \sum n_i F_{p,i}$ $V = \sum n_i V_i$ $\Delta_T = \sum n_i \Delta_{T,i}$	$F_t = \sum n_i F_{t,i}$ $F_p = \sum n_i F_{p,i}$ $V = \sum n_i V_i$ $\Delta_T^{(P)} = \sum n_i \Delta_{T,i}^{(P)}$
Auxiliary equations	$\log \alpha = 3.39 \dfrac{T_b}{T_{cr}} - 0.1585 - \log V,$ T_b = boiling point, T_{cr} = critical temp. $\left(\dfrac{T_b}{T_{cr}}\right) = 0.567 + \Delta_T - (\Delta_T)^2,$ Lyderson equation	$\alpha^{(P)} = \dfrac{777\Delta_T^{(P)}}{V}$ $\bar{n} = \dfrac{0.5}{\Delta_T^{(P)}}$
Expressions for δ and δ-components	$\delta_t = \dfrac{F_t + B}{V}$; $B = 277$	$\delta_t = \dfrac{F_t + \frac{B}{\bar{n}}}{V}$; $B = 277$

Next Page

TABLE 6. *cont'd*

Formulae	Solvents	Amorphous polymers
	$\delta_p = \delta_t\left(\frac{1}{\alpha}\frac{F_p}{F_t+B}\right)^{1/2}$	$\delta_p = \delta_t\left(\frac{1}{\alpha^{(P)}}\frac{F_p}{F_t+B/\bar{n}}\right)^{1/2}$
	$\delta_h = \delta_t\left(\frac{\alpha-1}{\alpha}\right)^{1/2}$	$\delta_h = \delta_t\left(\frac{\alpha^{(P)}-1}{\alpha^{(P)}}\right)^{1/2}$
	$\delta_d = (\delta_t^2 - \delta_p^2 - \delta_h^2)^{1/2}$	$\delta_d = (\delta_t^2 - \delta_p^2 - \delta_h^2)^{1/2}$

[a] In the equations given here, F_t is always combined with a Base value, α is the molecular aggregation number, and $\bar{n}$ the number of repeating units per polymer chain segment.

Water[c]	7732-18-5	18	15.5[a]	16.0[a]	42.4[a]	47.9
9.15. POLYHYDRIC ALCOHOLS						
Ethylene glycol	107-21-1	55.8	17	11	26	32.9
Glycerol	56-81-5	73.8	17.4	12.1	29.3	36.2
Propylene glycol (1,2-propanediol)	57-55-6	73.6	16.8	9.4	23.3	30.3
1,3-Butanediol	107-88-0	89.9	16.6	10	21.5	28.8
Diethylene glycol	111-46-6	95.3	16.2	14.7	20.5	29.9
Triethylene glycol	112-27-6	114	16	12.5	18.6	27.4
Hexylene glycol (2-methyl-2,4-pentanediol)	107-41-5	123	15.8	8.4	17.8	25.2
Dipropylene glycol[d]	110-98-5	131.3	16	20.3	18.4	31.7

[a] Altered from previously published value.
[b] Solid, treated as supercooled liquid.
[c] Values uncertain.
[d] Impure commercial product of this nominal formula.

By definition the optical activity, $[M]_\lambda$, of polymers and their low molecular weight analogs is given by

$$[M]_\lambda = [\alpha]_\lambda \times (\text{mean residue weight})/100$$

A. ABBREVIATIONS USED

AcAc	Acetylacetonate
AIBN	Azobisisobutyronitrile
BPO	Benzoyl peroxide
DBP	Dibenzoyl peroxide
DCA	Dichloroacetic acid
DCM	Dichloromethane
DDB	2,3-Dimethoxy-1,4-bis(dimethylamino)butane
DMAc	Dimethylacetamide
DMF	Dimethylformamide
DMSO	Dimethylsulfoxide
DPEDA-Li	*N,N'*-diphenylethylenediamine monolithium amide
EDC	Ethylene dichloride
M	Monomer
MC	Model compound
NCA	*N*-Carboxylic anhydride
P	Polymer
RT	Room temperature
TMEDA	*N,N,N',N'*-tetramethylethylenediamine
TCA	Trichloroacetic acid
TFA	Trifluoroacetic acid
TFEL	Trifluoroethanol
THF	Tetrahydrofuran

B. OPTICALLY ACTIVE POLYMERS FROM CHIRAL MONOMERS

TABLE 1. MAIN-CHAIN ACYCLIC CARBON POLYMERS

Polymer	Polymerization system		Polymer (P) values		Monomer (M) or model compound (MC) values		Optical activity measured		
Catalyst or initiator	Solvent	*T* (°C)	[α]D	[M]D	[α]D	[M]D	Solvent	*T* (°C)	Refs.
1.1. POLY(ALKENES)									
Poly[(*R*)(−)3,7-dimethyl-1-octene]									
$Al(i\text{-}C_4H_9)_3/TiCl_4$				−20 to −120		14.4 (MC)	Toluene	25	4,7
$Al(i\text{-}C_4H_9)_3/TiCl_3$				−35.3 to −144		14.4 (MC)	Toluene	25	
$LiAlH_4/TiCl_4$/monomer	Benzene	30–40	−78.1	−111	6.25	8.88 (MC)	Carbon tetrachloride	25	
Poly[(*S*)(+)5-methyl-1-heptene]									
$Al(i\text{-}C_4H_9)_3/TiCl_3$	Isooctane	RT		27.4–68.1		11.7 (MC)	Benzene		2–6
Poly[(*S*)(+)4-methyl-1-hexene]									
$Al(i\text{-}C_4H_9)_3/TiCl_4$	Isooctane	RT		205–288		21.3 (MC)	Benzene (MC); toluene (P)	25	2–6,9
$Al(i\text{-}C_4H_9)_3/TiCl_3$	Isooctane	RT		149–279		21.3(MC)	Benzene (P)	25	
Poly[(*S*)(+)6-methyl-1-octene]									
$Al(i\text{-}C_4H_9)_3/TiCl_3$	Isooctane	RT		16.0		13.3 (MC)	Benzene	25	4
				20.4		13.3 (MC)			5
Poly[(*S*)(+)3-methyl-1-pentene]									
$Al(i\text{-}C_4H_9)_3/TiCl_4$	–	20–25		29.4–158		−11.4 (MC)	Tetralin (P)	25 (P); 20 (MC)	2–6, 8,9
$Al(i\text{-}C_4H_9)_3/TiCl_3$	–	20–25		75.8–157		−11.4 (MC)	Tetralin (P)	25 (P); 20 (MC)	
				161					5
Poly[(*S*)5-phenyl-1-heptene]									
$Al(i\text{-}C_4H_9)_3/TiCl_3$	2,2,4-Trimethylpentane	25–60	26.6		4.80 (M)		Cyclohexane (P); neat (M)	25	118
Poly[(*R*)4-phenyl-1-hexene]									
$Al(i\text{-}C_4H_9)_3/TiCl_3$	2,2,4-Trimethylpentane	60	−61.6		−8.99 (M)		Chloroform (P); neat (M)	25	118
1.2. POLY(ACRYLICS) AND RELATED POLYMERS									
Poly(acryloyl-L-glutamic acid)									
AIBN	Dioxane	60	−21.0		−21.0 (MC)		Dioxane	25	12
Poly(L-bornyl acrylate)									
AIBN	–	65		−46.1		−56.4 (M)	Toluene	25	10
AIBN	Benzene	60		−47.2		−56.4 (M)	Toluene	25	
AIBN	Toluene	35		−47.4		−56.4 (M)	Toluene	25	
C_6H_5MgBr	Toluene	−70		−43.0		−56.4 (M)	Toluene	25	
UV benzoin	Toluene	−78		−47.2		−56.4 (M)	Toluene	25	
Poly(*d*-*sec*-butyl α-chloroacrylate)									
BPO	–	50–100		23.4		55.5 (M)	Chloroform (P); neat (M)	21 (P); 22 (M)	13
BPO	Dioxane	RT		17.9		42.2 (M)	Dioxane	25	14
Poly(*d*-*sec*-butyl α-bromoacrylate)									
BPO	Dioxane	RT		15.3		37.4 (M)	Dioxane	30	13
Poly(L-menthyl acrylate)									
AIBN	–	50	−79.0		−99.3 (M)		Benzene	22	11
AIBN	Benzene	60	−73.9		−88.3 (M)		Chloroform (P); neat (M)	25	215

Poly[(+)*N*-methyl-*N*-α-methylbenzyl-acrylamide]									
AIBN	–	60		278		504 (M)	Benzene	25	29
n-BuLi	Toluene	22		397		504 (M)	Benzene	25	
n-BuLi	Toluene	– 50		366		504 (M)	Benzene	25	
C_6H_5MgBr	Toluene	– 50		337		504 (M)	Benzene	25	
Poly[(–)*N*-propyl-*N*-α-methylbenzyl-acrylamide]

Polymer Catalyst or initiator	Polymerization system Solvent	 *T* (°C)	Polymer (P) Values $[\alpha]_D$	 $[M]_D$	 Origin of optical activity	Optical activity measured Solvent	 *T* (°C)	 Refs.
Poly(*N*-acryloylphenothiazine)								
Fluorenyllithium/(−)-sparteine	Toluene	−97	8.2		Helix-sense asymmetry	Chloroform	25	188
Poly(*N*,*N*-diphenylacrylamide)								
BuLi/(−)-sparteine	Toluene	−96	−44.2 to −50.9		Helix-sense asymmetry	THF	25	153
Fluorenyllithium/(−)-sparteine	Toluene	−97	−101			Chloroform	25	188
Poly[*N*,*N*-di(2-pyridyl)-acrylamide]								
Fluorenyllithium/(−)-sparteine	Toluene	−97	−23.7		Helix-sense asymmetry	Chloroform/DCA (22/1)	25	188
Poly[*N*-methyl-*N*-triphenylmethyl-acrylamide]								
n-BuLi/(−)-sparteine	Toluene	−78	−2.4		Helix-sense asymmetry	THF	25	188
Poly(1-phenyldibenzosuberyl acrylate)								
DPEDA-Li/(+)-DBB	Toluene	−40	−129		Helix-sense asymmetry	Chloroform	25	219
Poly(*N*-phenyl-*N*-1-naphthylacrylamide)								
BuLi/(−)-sparteine	Toluene	−78	8.7		Helix-sense asymmetry	Toluene	25	153,188
Poly(*N*-phenyl-*N*-2-naphthylacrylamide)								
BuLi/(−)-sparteine	Toluene	−78	81.7		Helix-sense asymmetry	Toluene	25	153,188
Poly[*N*-phenyl-*N*-(1-phenylethyl)-acrylamide]								
Fluorenyllithium/(−)-sparteine	Toluene	−97	−0.3		Helix-sense asymmetry	THF	25	188
Poly(triphenylmethyl acrylate)								
DPEDA-Li/(+)1-(2-pyrrolidinylmethyl)pyrrolidine	Toluene	−78	102 ($[\alpha]_{365}$)		Helix-sense asymmetry	Chloroform	25	186

4.2. POLY(METHACRYLICS) AND RELATED POLYMERS

Polymer Catalyst or initiator	Solvent	*T* (°C)	$[\alpha]_D$	$[M]_D$	Origin of optical activity	Solvent	*T* (°C)	Refs.
Poly(benzyl methacrylate)								
(*S*)2,3 : 4,5-bis[1,2-(3-methylnaphtho)]-1,6,9,12,15,18-hexaoxacycloeicosa-2,4-diene-*KO-tert*-Bu	95% Toluene–5% THF	−78	350 ($[\alpha]_{578}$)		Miscellaneous	THF	25	164
Poly(*tert*-butyl methacrylate)								
(*S*)2,3 : 4,5-bis[1,2-(3-methylnaphtho)]-1,6,9,12,15,18-hexaoxacycloeicosa-2,4-diene-*KO-tert*-Bu	95% Toluene–5% THF	−78	117 ($[\alpha]_{578}$)		Miscellaneous	THF	25	164
Poly(*m*-chlorophenyldiphenylmethyl methacrylate)								
DPEDA-Li/(+)-DDB	Toluene	−78	314		Helix-sense asymmetry	THF	25	220
Poly(cyclohexyldiphenylmethyl methacrylate)								
DPEDA-Li/(+)1-(2-pyrrolidinylmethyl)pyrrolidine	Toluene	−78	758 ($[\alpha]_{365}$)		Helix-sense asymmetry	Chloroform	25	240
			770 ($[\alpha]_{365}$)			Chloroform	60	
			−480 ($[\alpha]_{365}$)			Chloroform after 1 h	60	
Poly(cyclopropyldiphenylmethyl methacrylate)								
DPEDA-Li/(+)-DDB	Toluene	−78	−44 ($[\alpha]_{365}$)		Helix-sense asymmetry	Chloroform	25	240
Poly(diphenyl-*m*-fluorophenylmethyl methacrylate)								
DPEDA-Li/(+)-DDB	Toluene	−78	297		Helix-sense asymmetry	THF	25	220
Poly(diphenyl-2-pyridylmethyl methacrylate)								
DPEDA-Li/(−)-DDB	Toluene	−78	−1403 ($[\alpha]_{365}$)		Helix-sense asymmetry	90% Chloroform – 10% TFEL	25	155
Poly(diphenyl-4-pyridylmethyl methacrylate)								
BuLi/(−)-sparteine	Toluene	−78	−40 ($[\alpha]_{546}$)		Helix-sense asymmetry	90% Chloroform – 10% TFEL	25	154
Poly(methyl methacrylate)								
From poly(methacrylic acid) (potassium persulfate/dextrin, water, 0°C)			6.4 ($[\alpha]_{350}$)		Induced asymmetry	Benzene	25	162

From poly(methacrylic acid) (potassium persulfate/chitosan, water, 30°C)							
			16.6	Induced asymmetry	Chloroform	21	163
(*S*)2,3 : 4,5-bis[1,2-(3-methylnaphtho)]-1,6,9,12,15,18-hexaoxacycloeicosa-2,4-diene-*KO-tert*-Bu							
	95% Toluene–5% THF	−78	250 ($[\alpha]_{578}$)	Miscellaneous	THF	25	164
From poly(2,3-*O*-isopropylidene-1,4-di-*O*-methacryloyl-L-threitol) (AIBN, toluene, 60°C)							
			−4.3 ($[\alpha]_{405}$)	Induced asymmetry	Chloroform	20	244
Poly(1-phenyldibenzosuberyl methacrylate)							
Diisopropyl peroxydicarbonate	(+)Menthol/toluene	50	−200 ($[\alpha]_{365}$)	Helix-sense asymmetry	THF	25	196
Diisopropyl peroxydicarbonate	(−)Menthol/toluene	50	180 ($[\alpha]_{365}$)		THF	25	196
Diisopropyl peroxydicarbonate/ (+)neomenthanethiol	Toluene	40	−140 ($[\alpha]_{365}$)		THF	25	253
(−)Dimethyl peroxydicarbonate	Toluene	50	40 ($[\alpha]_{365}$)		THF	25	253
DPEDA-Li/(−)-sparteine	Toluene	−78	1670 ($[\alpha]_{365}$)		Chloroform	25	196
Poly[1-(2-pyridyl)dibenzosuberyl methacrylate]							
DPEDA-Li/(−)-sparteine	Toluene	−78	1290 ($[\alpha]_{365}$)	Helix-sense asymmetry	Chloroform	25	251
Poly(triphenylmethyl methacrylate)							
Li(R)-*N*-(1-phenylethyl)anilide	THF	−78	−104	Helix-sense asymmetry	Toluene	20	156
BuLi/(−)-sparteine	Toluene	−78	363		Toluene	20	
(*S*)-6-(2-dimethylaminoethyl)-1,11-dimethyl-6,7-dihydro-5H-dibenz[c,e]azepine							
	Toluene	−78	373		THF	25	157
Poly[tris(*m*-chlorophenyl)methyl methacrylate]							
DPEDA-Li/(−)-DDB	Toluene	−78	−251	Helix-sense asymmetry	THF	25	220
Poly[tris(*m*-tolyl)methyl methacrylate]							
DPEDA-Li/(−)-DDB	Toluene	−78	−234 ($[\alpha]_{546}$)	Helix-sense asymmetry	Chloroform	25	220

4.3. POLY(VINYL ETHERS)

Poly(benzofuran)							
$AlCl_3$/phenylalanine	Toluene	−75	24–56.7	Induced asymmetry	Benzene		169
$AlCl_3/Et_3SnCl$/(−)menthoxy-triethyltin	Toluene	−75	73.8		Benzene	18	242
Poly(α-naphthofuran)							
$2AlCl_3$/(−)-β-phenylalanine	Toluene	−75	41	Induced asymmetry	Chloroform	20	170
Poly(β-naphthofuran)							
$2AlCl_3$/(−)-β-phenylalanine	Toluene	−75	−145	Induced asymmetry	Chloroform	20	170
Poly(2-phenyl-1,3-dioxane-4,6-diyl) (Poly(benzaldehyde divinyl acetal))							
$ZnCl_2 \cdot OEt_2$/(+)-10-camphor-sulfonic acid	Toluene	0	−17.1 ($[\alpha]_{435}$)	Induced asymmetry	Chloroform	20	198
$ZnCl_2 \cdot OEt_2$/(−)-10-camphor-sulfonic acid	Toluene	0	13.7 ($[\alpha]_{435}$)		Chloroform	20	198

4.4. POLY(STYRENES)

Poly(4-iodostyrene)							
From copolymer of 3,4-*O*-cyclohexylidene-D-mannitol-1,2 : 5,6-bis-*O*-[(4-vinylphenyl)boronate] and styrene (AIBN, toluene, 60–70°C)							
			0 to −4.5 ($[\alpha]_{436}$)	Induced asymmetry	THF	30	179,180
Polystyrene							
From copolymer of 3,4-*O*-cyclohexylidene-D-mannitol-1,2 : 5,6-bis-*O*-[(4-vinylphenyl)boronate] and styrene (AIBN, toluene, 60–70°C)							
			−0.5 to −3.5 ($[\alpha]_{365}$)	Induced asymmetry	THF	30	179,180

4.5. POLY(DIENES)

Poly(3-carboxy-1-butenylene)							
From poly[1-(*d*-bornylammonium carboxylate)-1,3-butadiene] (AIBN, methanol, 50°C. See Section B. Table 1, 1.6)							
			0.2	Induced asymmetry	Methanol	25	177

TABLE 4. *cont'd*

Polymer	Polymerization system		Polymer (P) Values			Optical activity measured		
Catalyst or initiator	Solvent	*T* (°C)	$[\alpha]_D$	$[M]_D$	Origin of optical activity	Solvent	*T* (°C)	Refs.
From poly[1-(*S*(−)α-phenylethylammonium carboxylate)-1,3-butadiene] (AIBN, methanol, 50°C. See Section B. Table 1, 1.6)								
			−4.8	−4.7		Methanol	20	178
Poly(3-carboxy-4-methyl-1-butenylene) (Poly(sorbic acid))								
Potassium persulfate/chitosan	Water	50	2.32		Induced asymmetry	Methanol	20	161
From poly[1-((−)menthyloxycarbonyl)-1,3-pentadiene] (AIBN, benzene, 50°C. See Section B. Table 1, 1.6)								
			−58.3			THF	25	190
Poly[3-(ethoxycarbonyl)-1-butenylene]								
n-BuLi/sodium 1-menthoxide	Toluene	−78	−14.0		Induced asymmetry	Benzene	RT	176
n-BuLi/sodium *d*-bornoxide	Toluene	−78	6.0			Benzene	RT	
Poly[3-(methoxycarbonyl)-1-butenylene]								
n-BuLi/sodium 1-menthoxide	Toluene	−78	−2.4		Induced asymmetry	Benzene	RT	176
n-BuLi/sodium *d*-bornoxide	Toluene	−78	2.7			Benzene	RT	
Poly(*trans*-2-methyl-1,3-pentadiene)								
γ-ray/apocholic acid	–	50	−106		Induced asymmetry	Carbon tetrachloride	20	159
γ-ray/deoxycholic acid	–	50	90			Carbon tetrachloride	20	160
Poly(*cis*-2-methyl-1,3-pentadiene)								
γ-ray/apocholic acid	–	50	−66		Induced asymmetry	Carbon tetrachloride	20	159
γ-ray/deoxycholic acid	–	50	320			Carbon tetrachloride	20	160
Poly(1,3-pentadiene)								
$Al(C_2H_5)$/(−)titanium tetramenthoxide	Benzene	0	−22.8		Induced asymmetry	Hexane	18	171
Poly(*trans*-1,3-pentadiene)								
γ-ray/apocholic acid	–	50	−6.5		Induced asymmetry	Carbon tetrachloride	20	159
γ-ray/deoxycholic acid	–	RT	0.3			Chloroform	26	158
γ-ray/*trans*,anti,*trans*,anti,*trans*-perhydrotriphenylene								
Poly(*cis*-1,3-pentadiene)	–		2.5			Chloroform	25	172
γ-ray/apocholic acid	–	50	−3.7		Induced asymmetry	Carbon tetrachloride	20	159
γ-ray/deoxycholic acid	–	RT	−21			Chloroform	26	158

4.6. POLY(ISONITRILES)

Polymer / Catalyst or initiator	Solvent	*T* (°C)	$[\alpha]_D$	$[M]_D$	Origin of optical activity	Solvent	*T* (°C)	Refs.
Poly[(*tert*-butylimino)methylene]								
tris(*tert*-butyl isocyanide)[(*S*)(−)-(1-phenylethyl)amino(*tert*-butylamino)carbene]-nickel(II) perchlorate								
	Neat	RT	−28.7		Helix-sense asymmetry	Chloroform	20	207
Poly[5,8-dimethyl-6,7-bis(propoxymethyl)-quinoxaline-2,3-diyl] (Poly[1,2-diisocyano-3,6-dimethyl-4,5-bis(propoxymethyl)benzene])								
(+)oligo(5,8-di-*p*-tolylquinoxaline-2,3-diyl)/Pd(II)								
	THF	RT	−171		Helix-sense asymmetry			204

4.7. POLY(MALEIMIDES)

Polymer / Catalyst or initiator	Solvent	*T* (°C)	$[\alpha]_D$	$[M]_D$	Origin of optical activity	Solvent	*T* (°C)	Refs.
Poly(*N*-benzyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	11.3		Induced asymmetry	Chloroform or THF		181
Poly(*N*-*n*-butyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	−7.1		Induced asymmetry	Chloroform or THF		181
Poly(*N*-sec-butyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	6	−21.0		Induced asymmetry	Chloroform or THF		181

Poly(*N-tert*-butyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	2.8		Induced asymmetry	Chloroform or THF		181
Poly(*N*-cyclohexyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	−39.5		Induced asymmetry	Chloroform or THF		181
Poly(*N*-2-fluorenyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	−0.4		Induced asymmetry	Chloroform or THF		181
Poly(*N*-isobutyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	−13.4		Induced asymmetry	Chloroform or THF		181
Poly(*N*-isopropyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	−18.7		Induced asymmetry	Chloroform or THF		181
Poly(*N*-1-naphthyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	0.9		Induced asymmetry	Chloroform or THF		181
Poly(*N*-phenyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	−15.4		Induced asymmetry	Chloroform or THF		181
n-BuLi/(−)-sparteine/CuI	Toluene	0	−23.7 ($[\alpha]_{435}$)			Chloroform	25	241
Poly(*N-n*-propyl maleimide)								
n-BuLi/(−)-sparteine	Toluene	0	−4.9		Induced asymmetry	Chloroform or THF		181
4.8. OTHER COMPOUNDS								
Poly(methylene-1,3-cyclopentylene) (from 1,5-hexadiene)								
(+)(*S,S*)ethylene-1,2-bis(η^5-4,5,6,7-tetrahydro-1-indenyl)zirconium-1,1′-bi-2-naphtholate/methylaluminoxane								
	Toluene	RT		51.0 ($[M]_{405}$)	Induced asymmetry	Chloroform	28	239
Poly[1-(*m*-tolylsulfonyl)ethylene]								
From poly(*m*-tolyl vinyl sulfoxide) (*n*-BuLi/(−)-sparteine, toluene, −78°C. See Section B, Table 1, 1.10)								
			42		Miscellaneous			246

TABLE 5. MAIN-CHAIN ACYCLIC HETROATOM POLYMERS

A. INTRODUCTION

Segmental anisotropy $(\alpha_1 - \alpha_2)^*$ of a chain molecule may be determined experimentally from measurements of flow birefringence in the solution of a polymer with a sufficiently high molecular weight, so that the conformation of its molecules would correspond to that of a Gaussian coil.

For calculating $(\alpha_1 - \alpha_2)^*$, Kuhn's equation was used (Ref. 1):

$$\frac{\Delta n}{\Delta \tau} = \left[\frac{\Delta n}{g(\eta - \eta_0)}\right]_{\substack{g\to 0\\ c\to 0}} \equiv \frac{[n]}{[\eta]} = \frac{4\pi}{45kT} \times \frac{(n^2+2)^2}{n}(\alpha_1 - \alpha_2)^* \quad \text{(A1)}$$

where $\Delta\tau$ is the tangential flow stress (shearing stress), Δn is the observed flow birefringence of the solution, g is the velocity gradient, c and η are the concentration and the viscosity of the solution, respectively, $[\eta]$ and $[n]$ are intrinsic values of viscosity and flow birefringence of the solution, and η_0 and n are the viscosity and the refractive index of the solvent. The value $\Delta n/\Delta\tau = [n]/[\eta]$ may be called the shear optical coefficient.

Another method of determining segmental anisotropy (which is seldom used) is through the measurement of stress birefringence in swollen polymers (74). The stress optical coefficient $\varepsilon = \Delta n/\Delta p$ (where Δp is the normal stress in the sample) determined experimentally is equal to $\Delta n/2\Delta\tau$ (2), where $\Delta n/\Delta\tau$ is also related to $(\alpha_1 - \alpha_2)^*$ according to Eq. (A1). Data obtained by this method are marked in the table with the symbol sw. p. (swollen polymer).

If the refractive indices of the polymer and the solvent are not equal, the experimental value of $(\alpha_1 - \alpha_2)^*$ includes not only the intrinsic segmental $(\alpha_1 - \alpha_2)$, but also a part produced by the form effect (3,4). In this case the value $\alpha_1 - \alpha_2$ may be calculated using $(\alpha_1 - \alpha_2)^*$ and the theoretical equation for macro- and micro-form effects (3,4).

For determining $\alpha_1 - \alpha_2$, it is preferable to use the "matching" solvent in which the increment of index of the polymer, dn/dc, is equal to zero

The tables give the intrinsic segmental anisotropy, $\alpha_1 - \alpha_2$, obtained directly from measurements in the "matching" solvent, as well as the $(\alpha_1 - \alpha_2)^*$ values including the form effect. The corresponding figures are marked with the symbol *.

In some of the reviewed works in which measurements were carried out in "nonmatching" solvents, the segmental anisotropy was calculated on the basis of the theory of the form effect (3,4). In these cases the figures are marked with the symbol **.

Intrinsic segmental anisotropy of the polymer chain in various solvents, even in the absence of the form effect, may differ owing to a "specific" effect of the solvent (see, e.g., poly(vinyl acetate)) (5–11). "Specific" effect may probably includes phenomena such as a change in the type of rotation of the side groups (5,6,8,12), a change in the polarizability of its bonds, and the short-range ordering of the solvent molecules (11).

Principal values which effect the intrinsic segmental anisotropy of the chain are the anisotropy of the monomer unit and the equilibrium rigidity of the chain.

The Kuhn segment with the length A is the measure of the equilibrium rigidity of the chain. If the chain adopts the conformation of the Gaussian coil, then we have $A = \langle r^2 \rangle / L$, where L is the complete length of the extended chain and $\langle r^2 \rangle$ is the mean square end-to-end distance.

Also, $a_\parallel - a_\perp$ is the difference between the polarizabilities of the monomer unit in the parallel and perpendicular directions of the chain. Values of $a_\parallel - a_\perp$ presented in the table were calculated from

$$a_\parallel - a_\perp = (\alpha_1 - \alpha_2)\lambda / A \qquad \text{(A2)}$$

where λ is the length of the monomer unit in the chain direction. For cellulose esters, $a_\parallel - a_\perp$ and correspondingly, $\alpha_1 - \alpha_2$ depend on the degrees of substitution (DS), which are also given in the table.

For heterocyclic polycondensation polymers, the term "monomer unit" means the repeat unit of the polymer chain.

Many rigid-chain polymers have been investigated in the molecular-weight range in which their molecules exhibit a conformation intermediate between the rodlike conformation and the Gaussian coil. The best model for these polymers is the wormlike chain. Under these conditions the shear optical coefficient $\Delta n / \Delta \tau$ varies with the molecular weight M of the polymer and is given by the equation (100)

$$\Delta n / \Delta \tau = B \langle \gamma_1 - \gamma_2 \rangle \langle h^4 \rangle / \langle h^2 \rangle^2 \qquad \text{(A3)}$$

where $B = (4\pi / 45kT)(n^2 + 2)^2 / n$, $\langle \gamma_1 - \gamma_2 \rangle$ is the mean value of the wormlike chain optical anisotropy, $\langle h^2 \rangle$ and $\langle h^4 \rangle$ are the mean square and fourth degree end-to-end distance of the wormlike chain.

For the wormlike chain, the value of $\langle \gamma_1 - \gamma_2 \rangle$ as a function of the reduced chain length $x = 2L/A$ is given by the equations

$$\langle \gamma_1 - \gamma_2 \rangle = \frac{3}{5}(\alpha_1 - \alpha_2)\frac{f_1(x)}{1 - 0.8 f_1(x)/x} \qquad \text{(A4)}$$
$$f_1(x) = 1 - (1 - e^{-x})/x$$

According to Eqs. (A3) and (A4) the limit values of $\Delta n / \Delta \tau$ for wormlike chains are as follows: at $x \to 0$, $(\Delta n / \Delta \tau)_0 = B \langle \gamma_1 - \gamma_1 \rangle x \to 0$ as for a thin rod, and at $x \to \infty$, $(\Delta n / \Delta \tau)_\infty = B(\alpha_1 - \alpha_2)$ as for a kinetically flexible Gaussian coil.

The dependence of $\Delta n / \Delta \tau$ on M for the wormlike chains given by the Eqs. (A3) and (A4) may be approximated (100,101) by a linear relationship (A5) between the inverse values $(\Delta n / \Delta \tau)^{-1}$ and M^{-1}:

$$\frac{4\pi}{45kT} \times \frac{(n^2+2)^2}{n} (\Delta n / \Delta \tau)^{-1} = (\alpha_1 - \alpha_2)^{-1} + (M_0 / \Delta a) \times M^{-1} \qquad \text{(A5)}$$

where M_0 is the molecular weight of the repeat unit of the chain. If the experimental dependence of $(\Delta n / \Delta \tau)^{-1}$ on $1/M$ is plotted, the slope of the straight line obtained makes it possible to calculate $\Delta a = a_\parallel - a_\perp$, and its intercept with the ordinate gives $\alpha_1 - \alpha_2$.

Gelation Properties of Polymer Solutions

A. Hiltner
Department of Macromolecular Science, School of Engineering, Case Western Reserve University, Cleveland, OH, USA

Some polymer solutions show the phenomenon of gelation. The polymeric chains form association complexes at widely separated points at a certain reduced solvent power of the medium. This leads to the formation of a continuous physical network structure extending throughout the volume of the system. The association producing quasi-crosslinkages is a reversible process, so that the gel may be liquified and reset many times. The nature of the linkages is rather imperfectly understood, but the phenomenon is usually encountered with more or less crystalline polymers. Sometimes, sharp X-ray diffraction patterns are observed which disappear at the melting point of the gel.

The table contains data for a selected number of synthetic polymers which are capable of forming physical, thermoreversible gels with various solvents. Since no standard definition or standard measurement methods have been established for physical polymer gels, the gelation properties are taken from the references cited.

EXPLANATION OF ABBREVIATIONS USED

M_w The molecular weight of polymer refers to the weight average molecular weight unless otherwise stated.

λ The branch density of branched polymer.

S The syndiotacticity diad content in %.

T_{gel} The temperature (in degrees centigrade) at which the gel forms when the solution is cooled; the sol–gel transition temperature.

T_m The melting temperature (in degrees centigrade); the gel–sol transition temperature.

ΔH_m When DSC was used, this is the enthalpy associated with the endotherm. When other methods are used, ΔH is obtained from the van't Hoff plot.

Methods Used for the Measurement of Melting Temperature of the Gel

1. *Flow:* A U-tube in which the two limbs are joined by a capillary section is used. The gel is allowed to set with different heights in the two links and the melting point is the temperature at which flow starts from one limb to the other.
2. *Ball drop:* A steel ball with a known diameter or weight is placed on the gel and the gel warmed at a certain heating rate. The ball drops at the gel melting temperature.
3. *DSC:* Differential scanning calorimetry.
4. *Tilting:* The gel is warmed in the test tube and the melting point is observed when the gel begins to flow under its own weight when the upright test tube is tilted.

  1.2. ISO Codes for Items in Data Block 2 VIII-20
  1.3. ISO Codes for Items in Data Block 3 VIII-20
  1.4. ISO Codes for Extending and Reinforcing Fillers (Data Block 4) VIII-20
  1.5. ISO Codes for Data Block 5 VIII-21
H. SPI Codes for the Recycling of Plastics VIII-21
I. Recommended Abbreviations and Acronyms for Names of Elastomers VIII-21
J. Abbreviations for Textile Fibers VIII-22

A. INTRODUCTION

Abbreviations and acronyms for the names of thermoplastics, thermosets, fibers, elastomers, and additives have been proposed by many national and international organizations. Some of these abbreviations were introduced by law, others are trademarks in certain countries. As a result, the same abbreviation is often used for different polymers. The same polymer may also have different abbreviations or acronyms. Furthermore, some abbreviations refer to chemical compounds (IUPAC) whereas abbreviations recommended by ASTM, BS, DIN, and ISO usually refer to plastics, fibers, elastomers, etc., that are *based* on the corresponding polymers, i.e., polymers plus additives, modifiers, fillers, etc.

The following tables report abbreviations either found in the scientific or technical literature or recommended or proposed by the organizations listed below. Note that * and ** are part of the recommended ASTM abbreviations and acronyms and *not* symbols for footnotes.

ANSI/ASTM	American National Standards Institute (ASTM D 1600–75; D 1600–86a; D 1418–77)
ASTM	American Society for Testing of Materials (ASTM D 1600–64; D 1600–86a; D 1418–67; D 4020–81)
BS	British Standards (Standard 3502–1862)
DIN	German Industrial Standard (DIN 7723, 7728, 16913, 55950, 60001)
EDV	Data processing key of the European Textile Characterization Law
EC	European Community
ISO	International Organization for Standardization (ISO 1043–1980, 1629–1980)
IUPAC	International Union for Pure and Applied Chemistry [*Pure Appl. Chem.*, **18**, 583 (1969); **40**, 473 (1974); **59**, 691 (1987)]
WTR	Working Group Toxicology of Rubber Auxiliaries

Section B lists, in alphabetical order, the abbreviations and acronyms for thermoplastics, thermosets, fibers, elastomers, and additives. Sections C and D list the abbreviations for polymers, based on their monomeric units and characteristic groups, respectively. Section E contains abbreviations and acronyms for polymers obtained by chemical transformation of base polymers. Section F contains special abbreviations for blends, reinforced polymers, etc., and Section G the ISO and DIN codes for plastics. Section H lists the special abbreviations connected with the recycling of plastics. Recommended abbreviations and acronyms for elastomers and fibers are given in Sections I and J, respectively.

The material presented has been reproduced (with small corrections and additions) with the permission of the following publishers:

Hüthig Verlag, Heidelberg (H.-G. Elias, Makromoleküle, vol. II, 5th ed. 1992; Tables 2–5 and 8–10);
VCH Verlag, Weinheim (H.-G. Elias, An Introduction to Plastics, 1993; Table 6 (incl. text)).

B. ABBREVIATIONS IN ALPHABETICAL ORDER

AB	Manila hemp fibers (Abaca) (EDV); see also Ma
ABR	Acrylate–butadiene rubber; elastomeric copolymer from an acrylic ester and butadiene (ANSI/ASTM, IUPAC); see also AR
ABS	Acrylonitrile–butadiene–styrene; a thermoplastic from acrylonitrile, butadiene and styrene (ASTM, DIN, ISO, IUPAC)
AC	Fiber from deacetylated cellulose acetate (EDV)
ACM	Elastic copolymer from an acrylic ester and a small proportion of a vulcanizable monomer, e.g., 2-chlorovinyl ether (ANSI, ASTM)
ACS	Thermoplastic blend of a copolymer from acrylonitrile and styrene with chlorinated poly(ethylene)
ACSP	Acetyl cyclohexylsulfonyl peroxide
ADA	Adipic acid
ADC	Azodicarbonamide (WTR), see also ADEC
ADCK	Activated azodicarbonamide (WTR)
ADEC	Ammonium diethyl dithiocarbamate (WTR); see also ADC
ADPA	Condensation product from acetone and diphenylamine (WTR)
AE	Aminoethyl (with cellulosics)
AES	Thermoplastic quaterpolymer from acrylonitrile, ethylene, propylene, and styrene
AF	Other fibers (i.e., those not specified by the EDV system)
AFK	Asbestos fiber reinforced plastic
AFMU	Elastomeric terpolymer from tetrafluoroethylene, trifluoronitrosomethane, and a small amount of nitrosoperfluorobutyric acid; nitroso rubber (ANSI/ASTM); see also CNR
AG	Alginate fiber (EDV)
Ag	1. Silver (IUPAC) 2. Esparto grass fiber (DIN)
AI	Amide-imide polymers
AIBN	*N,N*-Azobisisobutyronitrile
Ak	Angora wool (DIN)
AL	1. Alfalfa fibers (EDV) 2. Alginate fibers (DIN); see also AG
AMMA	Thermoplastic copolymer from acrylonitrile and methyl methacrylate (ASTM); see also A/MMA
A/MMA	See AMMA
An	Calatropis fiber (DIN)
AN	Acrylonitrile
An–AE	Elastomeric copolymer from acrylonitrile and acrylic ester; see also ANM
ANM	See AN–AE
AO	Antioxidant
Ap	Alpaca wool (DIN)
AP	Elastic copolymer from ethylene and propylene; see also APR, E/P, EPM, and EPR (older German literature)
APH	Alkylated phenol
APR	See AP
APT	Elastomeric copolymer from ethylene, propylene, and an unsaturated termonomer; see also APTK, EPD, EPDM, EPT, EPTR
APTK	Elastomeric copolymer from ethylene, propylene, and an unsaturated termonomer; see also APT, EPD, EPDM, EPT, EPTR
Aq	Anthraquinone
AR	1. Elastomeric copolymer from acrylic esters and olefins; see also ABR 2. Ardein fibers (DIN)
As	1. Arsenic (IUPAC). 2. Asbestos (DIN); see also AS
AS	Asbestos fiber (EDV); see also As
ASA	Thermoplastic copolymer from acrylonitrile, styrene, and acrylic esters (ASTM); see also A/S/A
A/S/A	Thermoplastic copolymer from acrylonitrile, styrene, and acrylic esters (DIN, ISO); see also ASA
ASE	Alkylsulfonic acid ester (ISO)
ASR	Alkylene sulfide rubber
ATE	Aluminium triethyl
ATH	Alumina trihydrate
ATO	Antimony trioxide
AU	1. Elastomeric polyurethane with polyester segments (ANSI/ASTM, ISO) 2. Polyester rubbers with carbon, oxygen, and nitrogen in the chain. Both classifications probably refer to the same type of elastomer
AU-I	AU, cross-linkable with isocyanates
AU-P	AU, cross-linkable with peroxides
BA	Condensation product of butyraldehyde and aniline (WTR)
BAA	Condensation product of butyraldehyde and aniline
BBP	Benzylbutyl phthalate (DIN, ISO)
BD	1. 1,4-Butanediol 2. Derivative of benzofuran
BDMA	Butanediol 1,4-dimethacrylate (WTR)
BDP	Butyldecyl phthalate (WTR)
BDSH	Benzene-1,3-disulfonyl hydrazide (WTR)
BFE	Bromotrifluoroethylene polymers

BFK	Boron fiber reinforced plastic (German technical literature)
BHA	Butylated hydroxyanisole; *t*-butyl-4-methoxyphenol
BHET	Bis(2-hydroxyethyl) terephthalate
BHT	Butylated hydroxytoluene; 2,6-di(*t*-butyl)-*p*-cresol
BiDMC	Bismuth dimethyl dithiocarbamate (WTR); see also BMDC
BIIR	Brominated elastomer from isobutene and isoprene; bromobutyl rubber (ANSI/ASTM)
BMC	Bulk molding compound
BMDC	Bismuth dimethyl dithiocarbamate (WTR)
BOA	Benzyl octyl adipate (= benzyl 2-ethylhexyl adipate) (ISO)
BOP	Benzyl octyl phthalate (= benzyl 2-ethylhexyl phthalate)
BOPP	Biaxially oriented poly(propylene) film; balanced oriented poly(propylene) film
BP	Poly(butadiene) rubber; see also BR and CBR
BPH	2,2′-Methylene-bis(4-methyl-6-*t*-butylphenol) (WTR)
BPO	Dibenzoyl peroxide
BR	Elastomeric poly(butadiene); butadiene rubber (ANSI/ASTM, IUPAC); see also BP and CBR
BSH	Benzene sulfonyl hydrazide (WTR)
BT	Thermoplastic poly(1-butene); see also Pb, PBT
BTDA	3,3′,4,4′-Benzophenonetetracarboxylic dianhydride
BTX	Benzene, toluene, and xylenes
Buna	Butadiene elastomers (old German literature). The first types were synthesized by sodium ("*Na*trium") initiated *bu*tadiene polymerizations, hence the name "Buna"; the various grades were differentiated by numbers (hence "number Buna"). Later Buna types were copolymers from the free-radical copolymerization of butadiene with various comonomers. These types were called "letter Buna" (Buna S = copolymer of butadiene and styrene, Buna N = copolymer of butadiene and acrylonitrile, etc.).
Butyl	Elastomeric copolymer from isobutene and isoprene; butyl rubber (BS); see also GR-I, IIR, PIBI
BVE	Butyl vinyl ether (WTR)
Bw	Cotton ("Baumwolle") (DIN); see also CO
C	1. Carbon (IUPAC) 2. Channel black 3. Cellophane (ASTM); "Cellophan®" is a registered trademark in Germany
C*	Saran coated cellophane (ASTM)
CA	1. Cellulose acetate (ASTM, DIN, ISO, IUPAC); see also AC 2. Hemp fibers (EDV)
CAB	Cellulose acetate–butyrate (ASTM, DIN, ISO, IUPAC)
CAP	Cellulose acetate–propionate (ASTM, DIN, ISO, IUPAC)
CAR	Carbon fiber
CBA	Chemical blowing agent
CBR	Butadiene rubber; 1,4-*cis*-poly(butadiene); see also BP and BR
CBS	*N*-Cyclohexyl-2-benzothiazolesulfene amide
CC	1. Cocos fiber (EDV) 2. Cupro (regenerated cellulose fibers *via* the copper/ammonia process (DIN); see also CU
CDB	Conjugated diene butyl elastomer
CdDEC	Cadmium diethyl dithiocarbamate (WTR); also Cd-DEDC
CDP	Cresyl diphenyl phosphate
CdPDC	Cadmium pentamethylene dithiocarbamate (WTR)
CE	Cellulose plastics in general (ASTM)
CEM	Poly(chlorotrifluoroethylene) (ASTM); see also CFM, CTFE, PCTFE
CF	Thermoset from cresol and formaldehyde; cresol–formaldehyde resin (ASTM, DIN, ISO, IUPAC)
CFK	1. Man-made fiber reinforced plastic (German technical literature: "*C*hemie*f*aserverstärkter *K*unststoff") 2. Carbon fiber reinforced plastic (German technical literature); see also CRP
CFM	1. Poly(chlorotrifluoroethylene) (ANSI/ASTM); see also CEM, CTFE, PCTFE 2. Copolymer from chlorotrifluoroethylene and vinylidene fluoride
CFRP	Carbon fiber reinforced plastics
CHC	Elastomeric copolymer from epichlorohydrin and ethylene oxide; see also ECO
CHDM	1,4-Cyclohexanedimethylol
CHR	Elastomeric poly(epichlorohydrin) (ISO); see also CO
CIIR	Postchlorinated elastomeric copolymer from isobutene and isoprene (ANSI/ASTM)
CL	Poly(vinyl chloride) fiber (EWG; EDV); see also PVC
CM	Postchlorinated poly(ethylene) (ANSI/ASTM); see also CPE
CMBT	Copper mercaptobenzothiazole, see also CuMBT
CMC	1. Carboxymethylcellulose (ASTM, DIN, ISO, IUPAC) 2. Critical micelle concentration

CMHEC	(Carboxymethyl/hydroxyethyl) cellulose
CMF	Classified mineral filler
CN	Cellulose nitrate (ASTM, DIN, ISO, IUPAC); see also NC, C/N
C/N	Cellulose nitrate, see also CN, NC
CNR	Elastomeric terpolymer from tetrafluoroethylene, trifluoronitrosomethane, and a small amount of an unsaturated termonomer, e.g., nitrosoperfluorobutyric acid; nitroso rubber, carboxynitroso rubber; see also AFMU
CO	1. Elastomeric poly(chloromethyl)oxirane; poly(epichlorohydrin) (ANSI/ASTM; ISO); see also CHR 2. Cotton (EDV); see also Bw
COX	Carboxylic rubber
CP	Cellulose propionate (ASTM, DIN, ISO, IUPAC)
C.P.	Chemically pure
CP2	Alternating copolymer from vinyl ether and maleic acid
CP4	Copolymer from acrylic acid and maleic acid
CPE	Chlorinated poly(ethylene) (ASTM); see also CM
CPET	Crystallizable poly(ethylene terephthalate) (i.e., a PET with fast-acting nucleating agents) (trade journals)
CPI	*cis*-Poly(isoprene); see also IR, PIP
CPP	Spinning paper (small cut strips from sodium cellulose or sulfite cellulose paper) or cellulon (wet strips from cellulose pulp) (DIN)
CPVC	1. Postchlorinated poly(vinyl chloride) (ASTM); see also PC, PeCe, PVCC 2. Critical pigment concentration
CR	Poly(chloroprene) (ANSI/ASTM, BS, IUPAC)
CRP	Carbon fiber reinforced plastics; see also CFK
CS	Casein (ASTM, DIN, ISO, IUPAC)
CSM	Chlorosulfonated poly(ethylene) (ANSI/ASTM); see also CSPR, CSR
CSPR	Chlorosulfonated poly(ethylene) (BS); see also CSM, CSR
CSR	Chlorosulfonated poly(ethylene); see also CM, CSPR
CT	1. Cellulose triacetate (DIN); see also CTA, TA 2. Continuous thread
CTA	Cellulose triacetate (ASTM); see also CT, TA
CTFE	Poly(chlorotrifluoroethylene) (ASTM); see also CEM, CFM, PCTFE
CTP	*N*-Cyclohexylthiophthalimide (WTR)
CTS	Compact tension specimen
CU	Copper silk ("cupro silk" = regenerated cellulose fibers) (EDV); see also CC
CuDEC	Copper diethyl dithiocarbamate (WTR); also CDC, CuDC
CuDMC	Copper dimethyl dithiocarbamate (WTR); see also CuDMDC
CuMBT	Copper mercaptobenzothiazole; see also CMBT
Culhp	Copper laminated hard paper (German technical literature)
CV	Viscose (rayon) (DIN); see also VI
DABCO®	Triethylenediamine = Diazabicyclo [2.2.2] octane
DAC	Diallyl chlorendate; diallyl 1,4,5,6,7,7-hexachlorobicyclo[2.2.2]hept-5-ene-2,3-dicarboxylate (ASTM)
DADI	Dianisidine diisocyanate (WTR)
DAF	Diallyl fumarate (ASTM)
DAIP	Diallyl isophthalate resin (ASTM)
DAM	Diallyl isophthalate resin (ASTM)
DAP	Diallyl phthalate resin (ASTM, DIN); see also FDAP
DATBP	Diallyl tetrabromophthalate
DBDPO	Decabromodiphenyl oxide
DBEEA	Dibutoxyethoxyethyl adipate (WTR)
DBEP	Bis(2-butoxyethyl) phthalate
DBF	Dibutyl fumarate
DBNPG	Dibromoneopentyl glycol
DBP	Dibutyl phthalate (ASTM, DIN, ISO, IUPAC)
DBPPD	*N,N'*-Di(*s*-butyl)-*p*-phenylenediamine (WTR)
DBS	Dibutyl sebacate
DBTDL	Dibutyltin dilaurate
DBTU	Dibutyl urea (WTR)
DCBS	Benzothiazyl-2-dicyclohexylsulfene amide (WTR)
DCHP	Dicyclohexyl phthalate
DCP	Dicapryl phthalate (ASTM, DIN, ISO, IUPAC)
DDP	Didecyl phthalate
DE	Diatomaceous earth
DEA	*N,N*-Diethylaniline
DEAE	(Diethylamino)ethyl- (with cellulose)
DEG	Diethylene glycol
DEHP	Bis(2-ethylhexyl) phthalate; see also DOP
DEP	Diethyl phthalate (ISO)
DETA	Diethylenetriamine (WTR)
DETU	Diethyl thiourea (WTR)
DGEBA	Diglycidyl ethers of bisphenol A
DHA	Dehydroacetic acid, acetic anhydride
DHBP	2,4-Dihydroxy benzophenone (WTR)
DHP	Diheptyl phthalate (ISO)
DHS	Dihexyl sebacate (WTR)
DHXP	Dihexyl phthalate (ISO)
DIBA	Diisobutyl adipate
DIBP	Diisobutyl phthalate (DIN, ISO)
DIDA	Diisodecyl adipate (ASTM, DIN, ISO, IUPAC)

DIDG	Diisodecyl glutarate
DIDP	Diisodecyl phthalate (ASTM, DIN, ISO, IUPAC)
DINA	Diisononyl adipate (ISO)
DINP	Diisononyl phthalate (DIN, ISO)
DIOA	Diisooctyl adipate (ASTM, DIN, ISO, IUPAC)
DIOF	Diisooctyl fumarate
DIOM	Diisooctyl maleate (WTR)
DIOP	Diisooctyl phthalate (ASTM, DIN, ISO, IUPAC)
DIOS	Diisooctyl sebacate
DIOZ	Diisooctyl azelate
DIPP	Diisopentyl phthalate
DITDP	Diisotridecyl phthalate (DIN, ISO); see also DITP
DITP	Diisotridecyl phthalate (DIN); see also DITDP
DLTDP	Dilauryl 3,3′-thiodipropionate
DMA	*N,N*-Dimethylacetamide
DMAA	*N,N*-Dimethylacetoacetamide
DMAC	*N,N*-Dimethylacetamide
DMBPPD	*N*-(1,3-Dimethylbutyl)-*N*′-phenyl-*p*-phenylenediamine (WTR)
DMBS	Dimethylbenzothiazylsulfeneamide (WTR)
DMC	Dough molding compound (UP resin) (DIN)
DME	1. Dimethylethanolamine, 2-(dimethylamino)ethanol
DMEP	Bis(2-methoxyethyl) phthalate
DMF	1. *N,N*-Dimethyl phthalate (ISO); 2. *N,N*-dimethyl formamide
DMG	Dimethyl glutarate
DMHPPD	*N,N*′-Di(3-methylheptyl)-*p*-phenylenediamine (WTR)
DMP	Dimethyl phthalate (ISO)
DMPTD	Dimethylphenyl thiuram disulfide (WTR)
DMSO	Dimethyl sulfoxide
DMT	Dimethyl terephthalate
DMTD	2,5-Dimercapto-1,3,4-thiadiazole (WTR)
DMTDP	Dimyristyl-3,3′-thiodipropionate
DMTDS	2,5-Dimercapto-1,3,4-thiadiazole disulfide (WTR)
DNA	1. Deoxyribonucleic acid 2. Dinonyl adipate
DNHZ	Di(*n*-hexyl) azelate
DNODA	Di(*n*-octadecyl) adipate
DNPDP	Di(*n*-octadecyl) phthalate (ASTM)
DNP	Dinonyl phthalate (ASTM, ISO, IUPAC)
DNPT	*N,N*-Dinitrosopentamethylene tetramine
DNS	1. Di(3,5,5-trimethylhexyl) sebacate (WTR) 2. Deoxyribonucleic acid (German: Desoxyribonukleinsäure)
DOA	Dioctyl adipate, bis(2-ethylhexyl)adipate (ASTM, DIN, ISO, IUPAC)
DODP	Di(octadecyl) phthalate (ISO)
DOF	Dioctyl fumarate
DOIP	Dioctyl isophthalate, bis(2-ethylhexyl) isophthalate (DIN, ISO)
DOM	Dioctyl maleate, bis(2-ethylhexyl) maleate (WTR)
DOP	Dioctyl phthalate, bis(2-ethylhexyl) phthalate (ASTM, DIN, ISO, IUPAC)
DOS	Dioctyl sebacate, bis(2-ethylhexyl) sebacate (ASTM, DIN, ISO, IUPAC)
DOTG	*N,N*′-Di(*o*-tolyl)guanidine (WTR)
DOTP	Dioctyl terephthalate, bis(2-ethylhexyl) terephthalate (DIN, ISO)
DOZ	Dioctyl azelate, bis(2-ethylhexyl) azelate (ASTM, DIN, ISO, IUPAC)
DPA	Diphenylamine
DPCF	Diphenyl cresyl phosphate (ASTM, ISO); see also DPCP
DPCP	Diphenyl cresyl phosphate (ASTM, ISO); see also DPCF
DPG	*N,N*′-Diphenylguanidine (WTR)
DPOF	Diphenyl 2-ethylhexyl phosphate (ASTM, ISO); see also EHDPP
DPOP	Diphenyl octyl phosphate
DPP	1. Diphenyl phthalate 2. Dipropyl phthalate
DPPD	*N,N*′-Diphenyl-*p*-phenylene diamine (WTR)
DPQD	Dibenzoyl-*p*-quinone dioxime
DPTD	Di(pentamethylene)thiuram hexasulfide, see also DPTH
DPTH	Di(pentamethylene)thiuram hexasulfide (WTR), see also DPTD
DPDM	Di(pentamethylene)thiuram monosulfide (WTR)
DPTT	Di(pentamethylene)thiuram tetrasulfide (WTR)
DPTU	Diphenyl thiourea (WTR)
DR	Degree of reaction
DRC	Dry rubber content
DS	Degree of substitution
DSTDP	Distearyl 3,3′-dithiopropionate
DTBP	Di(*t*-butyl) peroxide (WTR)
DTDC	Dithiodicaprolactam (WTR)
DTDM	4,4-Dithiodimorpholine (WTR)
DTDP	Di(tridecyl) phthalate
DTPD	1. Di(tridecyl) phthalate 2. *N,N*′-Ditolyl-*p*-phenylenediamine (WTR)
DUP	Di(undecyl) phthalate
DVB	Divinyl benzene
EA	Segmented polyurethane fiber (Elasthan fiber) (EDV); see also PUE
EAA	Ethylene acrylic acid copolymers
EAM	Elastomeric copolymer of ethylene and vinyl acetate (ANSI/ASTM)
EBM	Extrusion blow molding

EC	Ethyl cellulose (ASTM, DIN, ISO, IUPAC)
ECB	Blends from ethylene copolymers with bitumen
ECO	Elastomeric copolymer from ethylene oxide and epichlorohydrin, chloromethyloxirane (ANSI/ASTM); see also CHC
ECTFE	Poly(ethylene-*co*-chlorotrifluoroethylene); see also E-CTFE
E-CTFE	Poly(ethylene-*co*-chlorotrifluoroethylene); see also ECTFE
EDA	Ethylene diamine (WTR)
EDC	Ethylene dichloride, 1,2-dichloroethane
EDMA	Ethylene glycol dimethacrylate
EDTA	Ethylenediaminetetraacetic acid
EEA	Elastomeric copolymer from ethylene and ethyl acrylate (ASTM); see also E/EA
E/EA	Elastomeric copolymer from ethylene and ethyl acrylate (ISO); see also EEA
EG	Ethylene glycol
EHDPP	2-Ethylhexyldiphenyl phosphate; see also DPOF
EHEC	Hydroxyethylcellulose
EL	Elastodiene fiber (EDV); see also EU, LA
ELO	Epoxidized linseed oil (DIN, ISO)
EMA	1. Copolymer from ethylene and methacrylic acid (ASTM) 2. Alternating copolymer from ethylene and maleic anhydride
EOT	Ethylene oxide polysulfide
EP	Epoxy resin (ASTM, DIN, ISO, IUPAC)
E/P	Copolymer from ethylene and propylene (ISO); see also AP, APR, EPM, EPR
EPC	Easy processing channel black
EPD	Elastomeric terpolymer from ethylene, propylene, and a nonconjugated diene (ASTM); see also APT, EPDM, EPT, EPTR
EPDM	Elastomeric terpolymer from ethylene, propylene, and a nonconjugated diene (ASTM); see also, APT, APTK, EPD, EPT, EPTR
EPE	Ester of an epoxy resin (DIN)
EP-G-G	Prepreg from an epoxy resin and a textile glass fabric (German technical literature)
EP-K-L	Prepreg from an epoxy resin and a carbon fiber fabric (German technical literature)
EPM	Elastomeric copolymer of ethylene and propylene (ANSI/ASTM, ISO); see also AP, APR, E/P, EPM, EPR
EPR	Elastomeric copolymer of ethylene and propylene (BS); see also AP, APR, E/P, EPM
EPS	Expanded poly(styrene) [poly(styrene) foam]
EPT	Elastomeric terpolymer from ethylene, propylene and a diene; see also APT, APTK, EPD, EPDM, EPTR
EPTD	Diethyl diphenyl thiuram disulfide (WTR)
EPTM	Diethyl diphenyl thiuram monosulfide (WTR)
EPTR	Elastomeric terpolymer from ethylene, propylene and a diene (BS); see also APT, APTK, EPD, EPDM, EPT
E-PVC	Emulsion-polymerized poly(vinyl chloride)
ERM	Elastin reservoir molding
E-SBR	Copolymer from styrene and butadiene, polymerized in emulsion
ESC	Environmental stress cracking
ESCR	Environmental stress cracking resistance
ESO	Epoxidized soy bean oil (DIN, ISO)
ET	Ethylene polysulfide
ETCH	Ethylene chlorohydrine; 2-chloroethanol
ETFE	Copolymer of ethylene and tetrafluoroethylene (ASTM)
E/TFE	Copolymer of ethylene and tetrafluoroethylene
ETG	Ethylene triglycol
ETMQ	2,2,4-Trimethyl-1,2-dihydro-6-ethoxy quinoline (WTR)
EU	1. Elastomeric polyurethane with polyether segments (ANSI/ASTM) 2. Polyether rubber with carbon, oxygen, and nitrogen in the polymer chain (ISO) 3. Elastodiene fibers (ASTM); see also EL, LA Classifications 1 and 2 probably refer to the same polymer
EVA	Copolymer from ethylene and vinyl acetate (ASTM, DIN, ISO); see also E/VAC, EVM, VAE
E/VAC	Copolymer from ethylene and vinyl acetate (ASTM, DIN); see also E/VAC, EVM, VAE
EVAL®	Copolymer of ethylene and vinyl alcohol
E/VAL	Copolymer of ethylene and vinyl alcohol
EVE	Ethylene vinyl ether
EVOH®	Copolymer with ethylene and vinyl alcohol units
EVM	Elastomer from ethylene and vinyl acetate; see also EVA, E/VAC, VAE
F	1. Fluorine (IUPAC) 2. Furnace black
FC	Fluorocarbon
FDAP	Diallyl phthalate or resins therefrom, see also DAP
FE	Fluorine containing elastomer
FEF	Fast extruding furnace black
FEP	Copolymer from tetrafluoroethylene and hexafluoropropylene (ASTM, DIN, ISO, IUPAC); see also PFEP
FF	1. Resin from furan and formaldehyde (ASTM) 2. Fine furnace black

Fi	Fique (DIN)
FK	Fiber reinforced plastic ("faserverstärkter Kunststoff"; German technical literature)
FKM	Elastomer with saturated main chain and fluoro, perfluoroalkyl, or perfluoroalkoxy substituents (ANSI/ASTM); see also FPM
FL	Fluorofiber (EDV); probably fibers from poly(tetrafluoroethylene)
Fl	Flax (DIN)
FMQ	Methyl fluorosilicone rubber; see also MFQ
FPM	1. Elastomeric copolymer from vinylidene fluoride and hexafluoropropylene (ASTM) 2. Fluoroelastomers in general 3. Rubbers having fluoro and fluoroalkyl or fluoroalkoxy substituent groups at the polymer chain (ISO)
FPVC	Flexible PVC film
FQ	Elastomeric silicone with fluorine containing substituents (ASTM); see also FSI
FR	Flame retardant
FRP	Glass fiber reinforced polyester
FSI	Fluorinated silicone (ASTM); see also FQ
FT	Fine thermal black
FVMQ	Silicone rubber with fluorine, vinyl, and methyl substituents (ANSI/ASTM)
FVSI	Fluorosilicone
GC	Glass coupled
GEP	Glass fiber reinforced epoxy resin
GF	Glass fiber reinforced plastic; see also GFK
GF-EP	Glass fiber reinforced epoxy resin
GFK	Glass fiber reinforced plastic (German technical literature)
GF-PF	Glass fiber reinforced phenolic resin
GF-UP	Glass fiber reinforced unsaturated polyester (German technical literature)
GI	Broom (fibers from) (EDV)
GL	Glass fiber (DIN, EDV)
GP	1. Gutta percha 2. General purpose (ASTM)
GPF	General purpose furnace black
GPO	Elastomeric copolymer from propylene oxide and allyl glycidyl ether (ANSI/ASTM)
GR	1. Glass fiber reinforced 2. Former US symbol for "government rubber"
GR-A	Former US symbol for nitrile rubber; see also GR-N
GRAS	Generally recognized as safe
GR-I	Former US symbol for butyl rubber
GR-N	Former US symbol for nitrile rubber; see also GR-A
GRP	Glass fiber reinforced plastic
GR-P	Glass fiber reinforced plastic
GR-S	Former US symbol for styrene–butadiene rubber
Gu	Guanaco wool (DIN)
GU	Fibers from diene rubbers (old German technical literature)
GUP	Glass fiber reinforced unsaturated polyester resins (German technical literature)
GUR	Ultrahigh molecular weight poly(ethylene); see also UHMPE
GV	Glass fiber reinforced thermoplastics
HA	Human hair (EDV)
HAF	High abrasion furnace black
HBPA	2,2-bis(4-hydroxycyclohexyl)propane
HDI	Hexamethylene-1,6-diisocyanate (WTR)
HDPE	High-density poly(ethylene) (ASTM); in the older German technical literature, HDPE was sometimes used for poly(ethylene) from high pressure polymerizations ("Hochdruck"), i.e., for poly(ethylene)s with mostly *low* densities; see also PEH
He	1. Helium 2. Henequen (DIN); see also HE
HE	Henequen (EDV); see also He
HEC	Hydroxyethylcellulose
HEMA	2-Hydroxyethyl methacrylate
HEXA	Hexamethylene tetramine (WTR); see also HMT
HF	Half linen (EDV)
HFIP	Hexafluoroisopropanol; 1,1,1,3,3,3-hexafluoro-2-propanol; see also HFP
HFP	1. Hexafluoroisopropanol; see also HFIP 2. Hexafluoropropene
Hgw	Hard fabric ("Hartgewebe", German technical literature)
HIPS	High impact poly(styrene)
Hm	Hard mat (German technical literature)
HM	Hot melt adhesive
HMC	Sheet molding compound with high glass fiber content (UP resin) (DIN)
HMDAC	Hexamethylene diamine carbamate (WTR)
HMDI	Hydrogenated diphenylmethane diisocyanate
HMF	High-modulus furnace black
HMPT	Hexamethylphosphoric acid triamide; see also HPT
HMT	Hexamethylene tetramine
HMWPE	Poly(ethylene) with very high molar mass (molecular weight)
H-NBR	Hydrogenated nitrile rubber
HP	Hard paper (German technical literature)
HPA	Hydroxypropyl acrylate
HPC	1. Hydroxypropyl cellulose 2. Hard processing channel black
HPMC	(Hydroxypropyl)methyl cellulose
HPT	Hexamethyl phosphorotriamide; see also HMPT

HR	High resiliency foam
Hs	Hare hair (DIN)
HS	1. Heat stabilized 2. High percent solids
HTBA	High temperature blowing agent
HTE	Hydroxyl terminated polyether
HTST	High-temperature, short-term processing
Hz	Goat hair ("Haar von der Ziege"; DIN)
ICR	Initial concentration rubber (from undiluted natural rubber latex)
IEN	Interpenetrating elastomeric network
IFR	Intumescent flame retardant
IHPN	Interpenetrating homopolymer network
IIR	Elastomeric copolymer from isobutene and isoprene (ANSI/ASTM, IUPAC); see also Butyl, GR-I, PIBI
IM	Poly(isobutylene); see also PIB
IMW	Intermediate molecular weight
IPA	Isophthalic acid
IPDI	3-Isophorone diisocyanate (WTR)
IPN	Interpenetrating polymer network
IPO	Isopropyl oleate
IPP	Isopropyl percarbonate; diisopropyl peroxydicarbonate
IPPD	*N*-Isopropyl-*N*′-phenyl-*p*-phenylenediamine (WTR)
IR	Synthetic *cis*-1,4-poly(isoprene) (ANSI/ASTM, BS, IUPAC); see also CPI, PIP
IRT	Insect resistant treated
IS	Insoluble sulfur (WTR)
IT	Interrupted or split thread
IVE	Isobutyl vinyl ether
Ju	Jute (DIN); see also JU
JU	Jute (EDV); see also Ju
KA	Casein fibers (DIN)
KE	Kenaf (EDV); see also Kf
KEK	Carbon fiber reinforced plastic (DIN)
Kf	Kenaf (DIN); see also KE
KFA	Potassium fatty acid soap
Km	Camel hair (DIN)
Kn	Rabbit hair (DIN)
Ko	Coir (DIN)
Kp	Kapok (DIN); see also KP
KP	Kapok (EDV); see also Kp
Kz	Cashmere goat wool (DIN)
LA	Fibers from diene rubbers (DIN); see also EL, EU
LDPE	Low-density poly(ethylene) (ASTM); in the older German technical literature, LDPE was sometimes used for poly(ethylene) from low pressure polymerizations, i.e., for poly(ethylene)s with mostly *high* densities; see also NDPE
LI	Linen, flax (EDV)
LIM	Liquid impingement molding (now RIM)
LIPN	Latex interpenetrating polymer network
LLDPE	Linear low-density poly(ethylene) (ASTM)
Lm	Llama wool (DIN)
LRM	Liquid reaction molding (now RIM)
LRMR	Reinforced liquid reaction molding
L-SBR	Solution polymerized SBR
M	Medium thermal carbon black
Ma	Manila hemp fibers (Abaca) (DIN)
MA	1. Modacrylic fiber (EDV); see also PAM 2. Maleic anhydride
MABS	Copolymer from methyl methacrylate, acrylonitrile, butadiene, and styrene
MAN	Methacrylonitrile
MBI	Mercaptobenzimidazole; 2-benzimidazolethiol
MBS	1. Copolymer from methyl methacrylate, butadiene, and styrene 2. Benzthiazyl-2-sulfene morpholide (WTR)
MBSS	2-(4-Morpholinyldithio)benzothiazole (WTR)
MBT	Mercaptobenzothiazole; 2-benzthiazolethiol
MBTS	2-Benzthiazolyl disulfide
MC	Methyl cellulose
MCB	Monochlorobenzene
MD	Modal fiber (EDV)
MDA	1. Methylenediamine 2. 4,4′-Diaminodiphenylmethane
MDAC	4-Methyl-7-(diethylamino)coumarine
MDI	4,4′-Diphenylmethane diisocyanate; methylene di-*p*-phenylene diisocyanate
MDPE	Poly(ethylene) with medium density ($\approx 0.93-0.94\ g/cm^3$) (ASTM)
ME	Metal fiber (EDV)
MEK	Methyl ethyl ketone; 2-butanone
MEKP	Methyl ethyl ketone peroxide
MF	Melamine–formaldehyde resin (ASTM, DIN, ISO, IUPAC)
MFK	Metal fiber reinforced plastic (German technical literature)
MFQ	Silicone rubber having both methyl and fluorine substituent groups on the polymer chain (ISO); see also FMQ
MG	Maguey (EDV)
MMA	Methyl methacrylate (ASTM)
Mo	1. Molybdenum (IUPAC) 2. Mohair wool (DIN)
MOCA	4,4′-Methylenebis(2-chloroaniline); 3,3′-dichloro-4,4′-diaminodiphenylmethane
MOD	Modacryl fiber (EWG)
MP	Melamine–phenol–formaldehyde resin; see also MPF
MPE	Metallized polyester film

MPF	Melamine–phenol–formaldehyde resin (ISO); see also MP
MPPPD	*N*-Methyl-2-pentyl-*N*′-phenyl-*p*-phenylene diamine (WTR)
MPQ	Silicone rubbers having both methyl and phenyl substituent groups on the polymer chain (ISO); see also PMQ
MPTD	Dimethyl diphenyl thiuram disulfide (WTR)
M-PVC	PVC, polymerized in bulk (mass) (German technical literature)
MPVQ	Silicone rubbers having methyl, phenyl, and vinyl substituent groups on the polymer chain (ISO); see also PVMQ
MQ	Elastomeric silicones with methyl substituents (ANSI/ASTM)
MR	Mold resistant
Ms	Silk from the silkworm (mulberry spinner; *Bombyx mori L.*) (DIN)
MSA	Maleic anhydride (German technical literature)
MT	Metal fibers (DIN); see also ME
MTI	Methylene tri(*p*-phenylene isocyanate)
MTM	Mixed tertiary mercaptans
MVQ	Silicone rubbers having both methyl and vinyl substituent groups on the polymer chain (ISO); see also VMQ
MWR	Molding with rotation
NBR	Elastomeric copolymer from butadiene and acrylonitrile; nitrile rubber (ANSI/ASTM, BS, IUPAC); see also GR-N, PBAN
NC	Cellulose nitrate; see also SN
NCR	Elastomeric copolymer from acrylonitrile and chloroprene (ANSI/ASTM, IUPAC)
NDBC	Nickel dibutyl dithiocarbamate (WTR)
NDGA	Nordihydroguaiaretic acid
NDI	1,5-Diisocyanatonaphthalene (WTR)
NDOP	*n*-Decyl-*n*-octyl phthalate; see also ODP
NDPA	*N*-Nitrosodiphenylamine (WTR)
NDPE	Low-density poly(ethylene); see also LDPE
NEM	*N*-Ethylmorpholine
Nf	Phormium (DIN)
NHDP	*n*-Hexyl-*n*-decyl phthalate
NIR	Elastomeric copolymer from acrylonitrile and isoprene (ANSI/ASTM)
NK	Natural rubber; see also NR
NMP	*N*-Methylpyrrolidone
NODA	*n*-Octyl-*n*-decyl adipate
NODP	*n*-Octyl-*n*-decyl phthalate; see also ODP
NPG	Neopentyl glycol
NPP	*n*-Propyl percarbonate; dipropyl peroxydicarbonate
NR	Natural rubber (ANSI/ASTM, IUPAC); see also NK
OBSH	*p,p*′-Oxybis(benzenesulfonyl hydrazide)
ODP	Octadecyl phthalate (ISO); see also NODP
ODPA	Octylated diphenylamine (WTR)
ODPP	Octyldiphenyl phthalate
OER	Oil-extended rubber
OPET	Oriented poly(ethylene terephthalate)
OPP	Oriented poly(propylene) film or bottles; see also PP
OPR	Elastomeric polymer from propylene oxide
OPS	Oriented poly(styrene) film
OPVC	Oriented poly(vinyl chloride)
OT	Polysulfide rubber
OTBG	*o*-Tolyl biguanide (WTR)
OTOS	*N*-Oxydiethylenedithiocarbamyl-*N*′-oxydiethylenesulfamide (WTR)
P3FE	Poly(trifluoroethylene) (IUPAC)
PA	1. Polyamide (ASTM, DIN, ISO, IUPAC); the acronym PA is normally followed by a number, a combination of numbers, a letter, or a combination of letters and numbers. A single number *i* refers to a polyamide from an α,ω-amino acid or its lactam with *i* carbon atoms in the aliphatic chain of the monomeric unit. A combination of two numbers indicates polyamides from the polycondensation of a diamine and a dicarboxylic acid; the first number gives the number of methylene groups of aliphatic diamines, the second number the number of carbon atoms of straight-chain aliphatic dicarboxylic acids. Both numbers are sometimes separated by a period. "I" stands for isphthalic acid, "T" for terephthalic acid. 2. Phthalic anhydride
PA*	Saran coated polyamide (ASTM)
PA**	Metal coated polyamide (ASTM)
PAA	Poly(acrylic acid) (ASTM)
PAB	*p*-Aminobiphenyl
PABM	Polyaminobismaleimide
PAC	Poly(acrylonitrile) fiber (DIN, IUPAC); see also PAN, PC
PAE	Phthalate ester plasticizer
PAI	Polyamide-imide (ASTM)
PAM	Modacryl fiber (DIN); see also MA
PAMS	Poly(α-methyl styrene)
PAN	1. Poly(acrylonitrile) fiber (ASTM, IUPAC, EDV); see also PAC, PC. PAN^R is also a German trademark. 2. Phenyl-α-naphthylamine (WTR)
PAPA	Polyazelaic polyanhydride
PAPDC	Pentamethylene ammonium *N*-pentamethylene dithiocarbamate (WTR)
PAPI	Polymethylenepolyphenylene isocyanate; see also PMPPI

PARA	Polyarylamide (ASTM)
PAS	1. Polyaryl sulfone
	2. Poly(acrylic acid) (German technical literature)
PAT	Polyaminotriazole
PB	1. Poly(1-butene) (ASTM, DIN, ISO); see also BT, PBT
	2. Polyurea fiber (EDV); see also PUA
	3. Elastic polydiene fiber (German technical literature)
PBA	Physical blowing agent
PBAN	Copolymer from butadiene and acrylonitrile (ASTM); see also GR-N, NBR
PBB	Polybrominated biphenyl
PBI	Polybenzimidazole
PBMA	Poly(*n*-butyl methacrylate)
PBNA	Phenyl-β-naphthylamine; *N*-phenyl-2-naphthylamine
PBR	Copolymer from butadiene and vinylpyridine (ANSI/ASTM, IUPAC)
PBS	Copolymer from butadiene and styrene (ASTM); see also SB, GR-S, SBR
PBT	1. Poly(butylene terephthalate) (ASTM); see also PBTP, PTMT
	2. Poly(1-butene), see also BT, PB
	3. Poly(*p*-phenylenebenzobisthiazole)
PBTP	Poly(butylene terephthalate) (DIN, ISO); see also PTMT
PC	1. Polycarbonate (ASTM, DIN, ISO, IUPAC); see also PCO
	2. Poly(acrylonitrile) fiber (EWG, EDV); see also PAC, PAN
	3. Formerly: chlorinated PVC; see also CPVC, PeCe, PVCC
PCB	Polychlorinated biphenyl
PCD	Polycarbodiimide
PCDT	Poly(1,4-cyclohexylenedimethylene terephthalate)
PCF	Poly(chlorotrifluoroethylene) fiber (DIN)
PCO	Polycarbonate; see also PC
PCTFE	Poly(chlorotrifluoroethylene) (ASTM, DIN, ISO, IUPAC); see also CEM, CFM, CTFE
PCU	Unchlorinated poly(vinyl chloride) (old German technical literature)
PDAP	Poly(diallyl phthalate) (ASTM, DIN, ISO, IUPAC); see also DAP, FDAP
PDMS	Poly(dimethyl siloxane)
PE	1. Poly(ethylene) (ASTM, DIN, ISO, IUPAC); see also PL
	2. Polyester fiber (EWG)
	3. Pentaerythritol
PEA	Poly(ethyl acrylate)
PEC	Chlorinated poly(ethylene) (DIN, ISO); see also CPE
PeCe	Chlorinated PVC; see also CPVC, PC, PVCC
PEE	Polyester ether fibers (containing diol and *p*-hydroxybenzoate units) (DIN)
PEEK	Polyether ether ketone = Poly(oxy-1,4-phenylene-oxy-1,4-phenylene-carbonyl-1, 4-phenylene)
PEEKK	Polyether ether ketone ketone
PEG	Poly(ethylene glycol)
PEH	Poly(ethylene) with high density; see also HDPE
PEHA	Pentaethylenehexamine (WTR)
PE-HD	Poly(ethylene) with high density (DIN, ISO); see also HDPE, PEH
PEK	Polyether ketone
PEKEKK	Polyether ketone ether ketone ketone
PEKK	Polyether ketone ketone
PEL	Poly(ethylene) with low density; see also LDPE, PE-LD
PEM	Poly(ethylene) with medium density; see also MDPE
PEO	Poly(ethylene oxide) (ASTM, IUPAC); see also PEOX
PEOX	Poly(ethylene oxide) (DIN, ISO); see also PEO
PEP	Thermoplastic copolymer from ethylene and propylene
PES	1. Polyester fiber (DIN); see also PET, PL
	2. Polyether sulfone (ASTM); see also PSU
PESU	Polyether sulfone (ASTM); see also PES
PET	Poly(ethylene terephthalate) (ASTM); see also PETP, PE, PES
PET*	Saran coated PET (ASTM)
PETP	Poly(ethylene terephthalate) (ASTM, DIN, ISO, IUPAC); see also PET, PE, PES
PETS	Pentaerythryl tetrastearate (WTR)
PF	Phenol–formaldehyde resin (ASTM, DIN, ISO, IUPAC)
PFA	Perfluoroalkoxy resins, copolymers of tetrafluoroethylene and perfluorinated alkyl vinyl ethers
PFEP	Copolymer from tetrafluoroethylene and hexafluoropropylene; see also FEP
PF-P-B	Phenolic resin–paper prepreg
PG	Propylene glycol
PHAS	Poly(α-hydroxy acrylic acid)
PHA	Poly(hydroxyalkanoate)
PHB	1. Poly(*p*-hydroxybenzoate); see also POB
	2. Poly(α-hydroxybutyrate)
PHEMA	Poly(2-hydroxyethyl methacrylate)
PHP	Physiological hydrophilic polymers
PI	1. *trans*-1,4-Poly(isoprene), gutta percha (BS)
	2. Polyimide (ASTM)
	3. Paper (EDV)
PIB	Poly(isobutene) (ASTM, BS, DIN, ISO, IUPAC)

PIBI	Elastomeric copolymer from isobutene and isoprene (butyl rubber); see also Butyl, GR-I, IIR
PIBO	Poly(isobutylene oxide)
PIP	Synthetic *cis*-1,4-poly(isoprene); see also CPI, IR
PIR	Poly(isocyanurate) (DIN)
PIS	Poly(isobutylene)
PL	1. Poly(ethylene) (EWG); see also PE 2. Polyester fiber (EDV); see also PES, PET
PMA	1. Pyromellitic acid 2. Pyromellitic dianhydride 3. Poly(methyl acrylate)
PMAC	Polymethoxy acetal
PMCA	Poly(methyl α-chloromethacrylate) (ASTM)
PMF	Processed mineral fiber
PMI	Poly(methacrylimide)
PMMA	(Poly(methyl methacrylate) (ASTM, DIN, ISO, IUPAC)
PMMI	Poly(pyromellitimide)
PMP	Poly(4-methyl-1-pentene) (ASTM, DIN, ISO); see also TPX
PMPPI	Polymethylenepolyphenylene isocyanate; see also PAPI
PMQ	Silicon rubbers with methyl and phenyl substituents (ANSI/ASTM)
PMTT	3-Phenyl-5-mercapto-1,3,4-thiadiazole-2-thione (WTR)
PNA	Polynuclear aromatics
PNAH	Polynuclear aromatic hydrocarbons
PNF	Phosphorus nitrile fluoroelastomer
PNR	Poly(norbornene) rubber
PO	1. Elastomeric poly(propylene oxide) (ASTM) 2. Poly(olefin) 3. Phenoxy resin
POB	Poly(*p*-hydroxybenzoate); see also PHB
POM	Poly(oxymethylene), poly(formaldehyde) (ASTM, DIN, ISO, IUPAC)
POP	Poly(1,4-phenylene oxide) (ASTM); see also PPO
POR	Elastomeric copolymer from propylene oxide and allyl glycidyl ether
PP	Poly(propylene) (ASTM, DIN, EDV, ISO, IUPAC)
PP*	Metallized poly(propylene) (ASTM)
PPA	1. Poly(parabanic acid) 2. Poly(propylene adipate)
PPC	Chlorinated poly(propylene) (DIN)
PPI	Polymeric polyisocyanate
PPO®	Poly(oxy-1,4-phenylene) = "poly(phenylene oxide)"; see also POP
PPOX	Poly(propylene oxide) (ASTM, DIN, ISO)
PPP	Poly(*p*-phenylene)
PPS	Poly(*p*-phenylene sulfide) (ASTM)
PPSU	Poly(phenylene sulfone) (ASTM, DIN, ISO); see also PSU
PPT	Poly(propylene terephthalate)
PQ	Elastomeric silicone with phenyl substituents (ASTM)
PQD	*p*-Quinone dioxime (WTR)
PR	Regenerated protein fiber (EDV)
PS	Poly(styrene) (ASTM, DIN, ISO, IUPAC)
P-S	Pressure-sensitive adhesive
PSA	Pressure-sensitive adhesive
PSAB	Thermoplastic copolymer from styrene, acrylic ester and butadiene (DIN); see also SBV, S/B
PSAN	Thermoplastic copolymer from styrene and acrylonitrile (DIN), see also SAN
PSBR	Elastomeric terpolymer from vinylpyridine, styrene, and butadiene (ANSI/ASTM)
PSF	Polysulfone; see also PSO
PSI	Poly(methyl phenyl siloxane) (ASTM)
PSO	Polysulfone; see also PSF
PST	Poly(styrene) fiber with at least 85% styrene units (DIN)
PS-TSG	Poly(styrene) foam, processed by thermoplastic injection (German technical literature)
PSU	Poly(phenylene sulfone); see also PPSU
PSUL	Polysulfone (ASTM)
PTA	1. Purified terephthalic acid 2. Phthalic anhydride
PTF	Pole(tetrafluoroethylene) fiber
PTFE	Poly(tetrafluoroethylene) (ASTM, DIN, ISO, IUPAC)
PTMA	Poly(tetramethylene adipate)
PTMEG	Poly(tetramethylene ether glycol)
PTMG	Poly(oxytetramethylene glycol)
PTMT	Poly(tetramethylene terephthalate) = poly(butylene terephthalate) see also PBTP
PU	1. Polyurethane elastomer (BS) 2. Polyurethane fiber (EDV)
PUA	Polyurea fiber (DIN); see also PB
PUE	Segmented polyurethane fiber (DIN); see also EA
PUR	Polyurethane (ASTM, DIN, ISO, IUPAC); see also PU
PVA	1. Poly(vinyl acetate); see also PVAC 2. Poly(vinyl alcohol) (ASTM); see also PVAL, PVOH 3. Poly(vinyl alcohol) fiber with at least 85% vinyl alcohol units (DIN); see also VY 4. Poly(vinyl ether) (old German technical literature); see also PVOM, PVME
PVAC	Poly(vinyl acetate) (ASTM, DIN, ISO, IUPAC); see also PVA
PVAL	Poly(vinyl alcohol) (ASTM, DIN, ISO, IUPAC)

PVC	1. Poly(vinyl chloride) (ASTM, DIN, ISO, IUPAC); see also CL 2. Poly(vinyl chloride) fiber with at least 50 wt.% vinyl chloride units (DIN) 3. Pigment volume concentration
PVCA	Copolymer from vinyl chloride and vinyl acetate (ASTM, DIN, IUPAC); see also PVCAC
PVCAC	Copolymer from vinyl chloride and vinyl acetate (ASTM); see also PVCA
PVCC	Chlorinated PVC (DIN, ISO); see also CPVC, PC, PeCe
PVD	Poly(vinylidene chloride) fiber with at least 50 wt.% vinylidene chloride units (DIN); see also PVDC
PVDC	Poly(vinylidene chloride) (ASTM, DIN, ISO, IUPAC); see also PVD
PVDF	Poly(vinylidene fluoride) (ASTM, DIN, ISO, IUPAC); see also PVF
PVF	1. Poly(vinyl fluoride) (ASTM, DIN, ISO, IUPAC) 2. Poly(vinylidene fluoride); see also PVDF
PVFM	Poly(vinyl formal) (ASTM, DIN, ISO, IUPAC); see also PVFO
PVFO	Poly(vinyl formal) (DIN); see also PVFM
PVI	Poly(vinyl isobutyl ether)
PVID	Poly(vinylidene cyanide)
PVK	Poly(*N*-vinylcarbazole) (ASTM, DIN, ISO)
PVM	1. Copolymer from vinyl chloride and vinyl methyl ether 2. Fiber from the copolymer of vinyl and/or vinylidene compounds with a main component of at least 85 wt.% (DIN)
PVME	Poly(vinyl methyl ether)
PVMQ	Silicone rubber with methyl, phenyl, and vinyl substituents (ANSI/ASTM)
PVOH	Poly(vinyl alcohol); see also PVA, PVAL
PVP	Poly(*N*-vinylpyrrolidone) (ASTM, DIN, ISO)
PVSI	Poly(dimethyl siloxane) with phenyl and vinyl substituents (ASTM)
PY	Unsaturated polyester resins (BS)
QMC	Quick molding change
Ra	Ramie (DIN)
RA	Ramie (EDV)
RAM	Restricted area molding
RAN	Residual acrylonitrile (monomer in polymer)
RF	Resorcine–formaldehyde resin
Rh	1. Rhenium (IUPAC) 2. Horse hair ("Rosshaar") (DIN)
RHB	Reheat blow molding
RHC	Rubber hydrocarbon content
Ri	Cow hair ("Rind") (DIN)
RIM	Reaction injection molding
Ro	Rosella (DIN)
RP	Reinforced plastics
RP/C	Reinforced plastics (composite)
RP/M	Reinforced polyester (mortar)
RPVC	Rigid PVC film
RRIM	Reinforced reaction injection molding
RTP	Reinforced thermoplastic
RTV	Room temperature vulcanization
RVCM	Residual vinyl chloride monomer
RUC	Chlorinated isoprene rubber (DIN)
S	Styrene
SAF	Super abrasion furnace black
SAF-HS	High structure SAF
SAF-LS	Low-structure SAF
SAIB	Sucrose acetate isobutyrate
SAL	Salicylic acid
SAN	Thermoplastic copolymer from styrene and acrylonitrile (ASTM, DIN, ISO, IUPAC); see also PSAN
SB	Thermoplastic copolymer from styrene and butadiene (ASTM); see also S/B
S/B	Thermoplastic copolymer from styrene and butadiene (ANSI/ASTM, ISO, IUPAC); see also SB
SBP	1. *s*-Butyl percarbonate; di-*s*-butyl peroxydicarbonate 2. Styrene–butadiene resin
SBR	Elastomeric copolymer from styrene and butadiene (ASTM, BS, IUPAC); see also GR-S
SBS	1. Solid bleached sulfate 2. Styrene–butadiene–styrene triblock copolymer
SCR	Elastomeric copolymer from styrene and chloroprene (ANSI/ASTM, IUPAC)
SDD	Sodium dimethyldithiocarbamate
SDPA	Aralkylated diphenylamines (WTR)
SE	1. Sulfoethyl- (with cellulose) 2. Silk ("Seide") (EDV)
SEBS	Styrene–ethylene/butylene–styrene triblock copolymer (= hydrogenated styrene–isoprene–styrene triblock copolymer)
SEDC	Selenium diethyl dithiocarbamate (WTR)
S-EPDM	Sulfonated ethylene–propylene–diene terpolymer
SF	Structural foam
SFK	Synthetic fiber reinforced plastic (German technical literature)
SFP	Scrapless forming process
SHIPS	Super-high impact poly(styrene)
Si	1. Silicon (IUPAC) 2. Sisal (DIN); see also SI
SI	1. Silicones in general (ASTM, DIN, ISO) 2. Poly(dimethyl siloxane) (ASTM) 3. Thermoplastic silicone (IUPAC) 4. Sisal (EDV); see also SI

SIN	1. Simultaneous interpenetrating network 2. Semi-interpenetrating network
SIPN	Sequential interpenetrating polymer network
SIR	1. Elastomeric copolymer from styrene and isoprene (ANSI/ASTM, IUPAC) 2. Standardized Indonesian rubber
SIS	Styrene–isoprene–styrene triblock copolymer
SL	Slag wool (DIN)
SM	Styrene monomer
SMA	Copolymer from styrene and maleic anhydride (ASTM)
SMC	Sheet molding compound (UP resin)
SMR	Standardized Malaysian rubber
SMS	Copolymer from styrene and α-methylstyrene (ASTM, DIN); see also S/MS
S/MS	Copolymer from styrene and α-methylstyrene (DIN, ISO); see also SMS
Sn	1. Tin (IUPAC) 2. Sunn hemp fibers (DIN); see also SN
SN	Sunn hemp fibers (EDV)
SP	Superior processing rubber (a grade of natural rubber)
SPF	Superior processing furnace black
SPH	Styrenated phenol (WTR)
SPPF	Solid-phase pressure forming
SPSF	Solid-phase stretch forming
S-PVC	Poly(vinyl chloride), polymerized in suspension
SR	Synthetic rubber
SRF	Semi-reinforcing furnace black
SRF-HM	High-modulus SRF
SRF-HM-NS	Nonstaining high-modulus SRF
SRF-LM	Low-modulus SRF
SRF-LM-NS	Nonstaining low-modulus SRF
SRP	Rubber reinforced poly(styrene) (ASTM)
SS	1. Single stage (ASTM) 2. Steam-stripped (to remove residual monomer)
ST	Stone wool (DIN)
SWP	1. Solvent-welded plastics pipe 2. Synthetic wood pulp
T	1. Polysulfide rubber; see also OT, TR 2. Thermal black
TA	Cellulose triacetate (EDV); see also CT, CTA
TAC	Triallyl cyanurate (ASTM)
TATM	Triallyl trimellitate (WTR)
TBBS	Benzothiazyl-2-*t*-butyl sulfenamide (WTR)
TBC	Total Broadhurst Lee process
TBP	*t*-Butyl perbenzoate; see also TBPB
TBPA	Tetrabromophthalic anhydride
TBPB	*t*-Butyl perbenzoate; see also TBP
TBS	*t*-Butylstyrene
TBT	Tetrabutyl titanate
TBTD	Tetrabutyl thiuram disulfide (WTR); see also TBUT
TBTU	Tributyl thiourea (WTR)
TBUT	Tetrabutyl thiuram disulfide (WTR)
TC	Technically classified natural rubber
TCE	Trichloroethylene
TCEF	Trichloroethyl phosphate (ASTM, ISO); see also TCEP
TCF	Tricresyl phosphate, tritolyl phosphate (ASTM, DIN, ISO); see also TCP, TKP, TTP
TCM	Trichloromelamine (WTR)
TCP	Tricresyl phosphate (IUPAC); TCP® is a registered trademark in the United Kingdom; see also TCF, TKP, TTP
TDEC	Tellurium diethyl dithiocarbamate (WTR)
TDI	Tolylene diisocyanate; tolylene isocyanate; methylphenylene diisocyanate; usually an 80:20 mixture of the 2,4- and 2,6-isomers
TDID	Dimeric tolylene diisocyanate
TDM	*t*-Dodecyl mercaptan (WTR)
TEAE	Triethylaminoethyl- (with cellulose)
TEDMA	Triethylene glycol dimethacrylate (WTR)
TEGDA	Triethylene glycol diacetate (WTR)
TEP	Triethyl phosphate
TEPA	Tetraethylene pentamine (WTR)
TETA	Triethylene tetramine
TETD	Tetraethyl thiuram disulfide (WTR)
TFE	Tetrafluoroethylene (ASTM)
THBP	2,4,5-Trihydroxybutyrophenone
THF	Tetrahydrofuran
THT	Tetrahydrothiophene (WTR)
TIOTM	Triisooctyl trimellitate (DIN, ISO)
TKP	Tricresyl phosphate; see also TCE, TCP, TTP
Tl	1. Thallium (IUPAC) 2. American moss (DIN)
TM	Thioplastics
TMA	Trimellitic anhydride
TMC	Thick molding compound
TMETD	Tetramethyl tetraethyl thiuram disulfide (WTR)
TMP	1. Thermal mechanical pulp 2. Trimethylol propane (WTR)
TMPT	Trimethylol propane trimethacrylate (WTR)
TMQ	2,2,4-Trimethyl-1,2-dihydroquinone (WTR)
TMS	Tetramethylsilane
TMTD	Tetramethyl thiuram disulfide (WTR)
TMTS	Tetramethyl thiuram monosulfide (WTR)
TMTT	Tetramethyl thiuram tetrasulfide (WTR)
TMTU	Tetramethyl urea (WTR); see also TMU
TMU	Tetramethyl urea; see also TMTU
TNPP	Trinonyl phenyl phosphate (WTR)
TOF	Trioctyl phosphate = tris(2-ethylhexyl) phosphate (ASTM, DIN, ISO); see also TOP

TOP	Trioctyl phosphate = tris(2-ethylhexyl) phosphate (ASTM, DIN, ISO); see also TOF
TOPM	Tetraoctyl pyromellitate, i.e., tetrakis(2-ethylhexyl) pyromellitate (DIN, ISO)
TOR	*trans*-Poly(octenamer)
TOTM	Trioctyl mellitate = tris(2-ethylhexyl) pyromellitate (DIN, ISO)
TPA	1. 1,4-*trans*-Poly(pentenamer); see also TPR
	2. Terephthalic acid
TPE	Thermoplastic elastomer
TPEL	Thermoplastic rubber or elastomer (ASTM)
TPES	Thermoplastic polyester in general (ASTM)
TPF	Triphenyl phosphate (DIN, ISO); see also TPP
TPI	Thermoplastoid (WTR)
TPO	Thermoplastic olefin elastomer
TPP	Triphenyl phosphate (ASTM, IUPAC); see also TPF
TPR	1. 1,5-*trans*-Poly(pentenamer); see also TPA
	2. Thermoplastic elastomer; see also TR, TPE
TPS	Toughened poly(styrene) (in the UK for HIPS)
TPTD	Tetraisopropyl thiuram disulfide (WTR)
TPU	Thermoplastic polyurethanes
TPUR	Thermoplastic urethane (ASTM)
TPX	Poly(4-methyl-1-pentene); see also PMP
TR	1. Thermoplastic elastomer
	2. Thio rubber (in the UK for polysulfide)
	3. Textile residues or fiber or fabric of unknown composition (EDV)
TRIM	Trimethylolpropane trimethacrylate
Ts	Tussah silk (DIN)
TSH	Toluene sulfonyl hydrazide (WTR)
TSUR	Thermoset polyurethane (ASTM)
TTP	Tricresyl phosphate, tritolyl phosphate (ISO); see also TCE, TCP, TKP
TTT	Triethyltrimethylenetriamine (WTR)
TU	Thiourea
TV	Trivinyl fiber (EDV)
Tz	Tibet goat hair (goat = "Ziege") (DIN)
UE	Polyurethane elastomer (ASTM); see also UR
UF	Urea–formaldehyde resin (ASTM, DIN, ISO, IUPAC)
UFS	Urea–formaldehyde foam
UHMPE	Poly(ethylene) with ultrahigh molar mass
UHMW-PE	Poly(ethylene) with ultrahigh molar mass (molar mass over 3 100 000 g/mol) (ASTM)
UP	Unsaturated polyester (ASTM, DIN, ISO, IUPAC)
UP-G-G	Prepreg from unsaturated polyesters and textile glass fibers
UP-G-M	Prepreg from unsaturated polyesters and textile glass mats
UP-G-R	Prepreg from unsaturated polyesters and textile glass rovings
Ur	Urena (DIN)
UR	Polyurethane elastomers (BS); see also UP
VA	Vinyl acetate
VAC	Vinyl acetate
VAE	Vinyl acetate–ethylene copolymers; see also EVA, E/VAC
VC	Vinyl chloride
VC/E	Copolymer from ethylene and vinyl chloride (ISO)
VC/E/MA	Copolymer from ethylene, vinyl chloride, and maleic anhydride (ISO)
VC/E/VAC	Copolymer from ethylene, vinyl chloride, and vinyl acetate (ISO)
VCI	Volatile corrosion inhibitor
VCM	Vinyl chloride (monomer); see also VC
VC/MA	Copolymer from vinyl chloride and methyl acrylate (ISO)
VC/MMA	Copolymer from vinyl chloride and methyl methacrylate (ISO)
VC/OA	Copolymer from vinyl chloride and octyl acrylate (ISO)
VC/VAC	Copolymer from vinyl chloride and vinyl acetate (ISO)
VC/VDC	Copolymer from vinyl chloride and vinylidene chloride (ISO)
VDC	Vinylidene chloride
Vf	1. Vulcan fiber
	2. Vinyl fluoride
VF/HFP	Copolymer from vinylidene fluoride and hexafluoropropylene
Vi	Vicuna wool (DIN)
VI	Viscose (rayon) (EDV); see also CV
VMQ	Silicone rubber with methyl and phenyl substituents (ANSI/ASTM)
VPE	Cross-linked poly(ethylene) (DIN)
VQ	Elastomeric silicone with vinyl substituents (ASTM)
VRI	Volatile rust inhibitor
VSI	Poly(dimethyl siloxane) with vinyl groups (ASTM)
VT	Vinyl toluene
VVO	Vulcanized vegetable oil = factice (WTR)
VY	Vinal (= poly(vinyl alcohol) fiber) (ASTM, EDV)
WA	Angora (rabbit) wool (EDV)
WB	Beaver wool (EDV)
WFK	Whisker reinforced plastic (German technical literature)
WG	Vicuna wool (EDV)

WK	Camel wool (EDV)
WL	Llama wool (EDV)
WM	1. Plasticizer (German technical literature: "Weichmacher") 2. Mohair wool (EDV)
Wo	1. Tungsten (IUPAC) 2. Sheep's wool (DIN); see also WO
WO	Sheep's wool (EDV); see also Wo
WP	Alpaca wool (EDV)
WS	Cashmere goat wool (EDV)
WT	Otter wool (EDV)
WU	Guanaco wool (EDV)
WV	Virgin sheep wool (EDV)
WY	Yak wool (EDV)
XABS	Elastomeric copolymer from acrylonitrile, butadiene, styrene, and a carboxylic group containing monomer (ASTM)
XLPE	Crosslinked poly(ethylene)
XNBR	Elastomeric copolymer from acrylonitrile, butadiene, and a carboxylic group containing monomer (ANSI/ASTM)
XPS	Expandable (or expanded) poly(styrene)
XSBR	Elastomeric copolymer from butadiene, styrene, and a carboxylic group containing monomer (ANSI/ASTM)
YSBR	Thermoplastic triblock copolymer from styrene and butadiene (ANSI/ASTM); see also SBS
YXSBR	Thermoplastic block copolymer from styrene and butadiene containing carboxylic groups (ANSI/ASTM)
Z5MC	Zinc pentamethylene dithiocarbamate (WTR)
ZBDC	Zinc dibenzyl dithiocarbamate (WTR)
ZBPD	Zinc dibutyl dithiophosphate (WTR)
ZBX	Zinc dibutyl xanthate (WTR)
ZDBC	Zinc dibutyl dithiocarbamate (WTR)
ZDEC	Zinc diethyl dithiocarbamate (WTR)
ZDMC	Zinc dimethyl dithiocarbamate (WTR)
ZE	Zein fibers (DIN)
ZEH	Zinc ethylhexanoate (WTR)
ZEPC	Zinc ethylphenyl dithiocarbamate (WTR)
ZIX	Zinc isopropyl xanthate (WTR)
ZMBI	Zinc 2-mercaptobenzimidazole
ZMBT	Zinc-2-mercaptobenzthiazole

C. ABBREVIATIONS AND ACRONYMS BASED ON POLY(MONOMER) NAMES

The following table contains the abbreviations and acronyms of names of polymeric materials whose base polymers were obtained by chain polymerization (addition polymerization), copolymerization, polycondensation (condensation polymerization), and polyaddition. Note that these abbreviations and acronyms do not apply in industry to polymers *per se* but to polymeric materials, i.e. polymers with or without additives, fillers, plasticizers, etc.

Abbreviations and acronyms are in part based on the poly(monomer) nomenclature, i.e., on the names of the monomers used in the manufacture of polymers, sometimes however, without a prefix "P" for "poly". The names of monomers for copolymers are given in alphabetical order without regard to their prevalence.

Registered trademarks: a) SAN in Japan and the USA; b) PAN in Europe.

Polymers of	ASTM	DIN	ISO	IUPAC	Other
Acrylic ester + acrylonitrile + butadiene	ABA	A/B/A	A/B/A		
Acrylic ester + acrylonitrile + styrene	ASA	A/S/A	A/S/A		
Acrylic ester + ethylene	EEA		E/EA

Carboxymethyl cellulose	CMC	CMC	CMC	CMC	
Carboxymethyl hydroxyethyl cellulose					CMHEC
Casein, crosslinked with formaldehyde	CS	CS	CS	CS	
Cellulose, as Cellophan$^{®}$	C				
–, coated with Saran	C*				
Cellulose acetate	CA	CA	CA	CA	
Cellulose acetobutyrate	CAB	CAB	CAB	CAB	
Cellulose acetopropionate	CAP	CAP	CAP	CAP	
Cellulose nitrate	CN	CN	CN	CN	NC
Cellulose plastics, unspecified	CE				
Cellulose propionate	CP	CP	CP	CP	
Cellulose triacetate	CTA	CTA	CTA		TA
Ethyl cellulose	EC	EC	EC	EC	
Hydroxyethyl cellulose					HEC
Hydroxypropyl cellulose					HPC
Hydroxypropyl methyl cellulose					HPMC
Methyl cellulose		MC	MC		
Poly(ethylene), chlorinated	CPE	PE-C	PE-C		
–, chlorosulfonated	CSM				CSR
Poly(ethylene-*co*-vinyl alcohol)		E/VAL	E/VAL		
	EVAL™				
					EVOH
Poly(propylene), chlorinated		PPC			
Poly(vinyl alcohol)	PVAL	PVAL	PVAL	PVAL	PVOH
Poly(vinyl butyral)	PVB	PVB	PVB		
Poly(vinyl chloride), chlorinated	CPVC	PVC-C	PVC-C		PC, PeCe
Poly(vinyl formal)	PVFM	PVFM	PVFM	PVFM	

F. ABBREVIATIONS FOR BLENDS, REINFORCED POLYMERS, ETC.

For mixtures of polymers, ISO recommends that the symbols for the parent polymers be put in parentheses, separated by a plus sign; for example, (PMMA + ABS) for a physical blend of poly(methyl methacrylate) and ABS.

ASTM recommends GP for "general purpose" and SS for "single stage".

Resulting polymer	ASTM	DIN	ISO	IUPAC	Other
Bulk molding compound					BMC
Elastomers, thermoplastic					
–,–, containing ester and ether groups	TEEE				
–,–, olefin-based	TEO				
–,–, styrene-based	TES				
Epoxide, glass fiber reinforced			EP-G		GEP
Plastic, carbon fiber reinforced		KEK			CFP
–, glass fiber reinforced					GFK
–, man-made fiber reinforced					CFK
–, metal fiber reinforced					MFK
Poly(acrylonitrile-co-styrene) + chlorinated poly(ethylene)					ACS[a]
Poly(styrene), rubber-modified	SRP	IPS			HIPS
Sheet molding compound					SMC
–, with high glass fiber content		HMC			

G. ISO CODES FOR THERMOPLASTIC MATERIALS

The standard designation of a thermoplastic material consists of

- a *description block* (giving the type of material),
- a *standard number block* (consisting of the number of the ISO standard or a national standard such as DIN), followed by a hyphen, and
- an *individual item block* (with five data blocks).

An example is

Molding material DIN 7744-PA 12, XF, 22-030, GF 30

The code letters are arranged after the symbol for the base polymer according to ISO and DIN; in the technical literature, however, they are commonly placed in front of the base symbol, following ASTM, which uses similar code letters and asterisks.

A designation system similar to the above ISO/DIN system has been recommended by ASTM. A typical ASTM designation, for example, would read

Molding material ASTM D-4000 PI000G42360

This molding material is a polyimide (PI), whose properties have been specified via cell table G of the ASTM standard D-4000. This particular cell table identifies five different properties by designating cell limits to the five digits following the letter G. According to cell table G, the "4" indicates a tensile strength of at least 85 MPa. The measured flexural modulus is characterized by "2", the Izod impact strength of 50 J/m by "3", and the heat deflection temperature of 300°C by "6". The fifth digit is undetermined; the "0" indicates an unspecified property.

1. Codes for ISO Data Blocks 1–5

1.1. ISO and DIN Codes for Data Block 1 *Data block* 1 of the individual item block contains the abbreviation of the chemical name of the material, e.g., PA 12 (see example). This abbreviation may be followed by analytical data with respect to the composition of the material; an example is the content of vinyl acetate units in ethylene–vinyl acetate copolymers. Such chemical structure data may be composition, such as content of vinyl acetate (VAC) or acrylonitrile units (AN), configuration as measured by isotacticity ("isotaxy") (IT), branching as revealed by density (D).

These analytical data are, however, not the exact analytical data but rather code numbers for the range (called "cell") which will permit this material to substitute for a similar one. Separated by a hyphen, other supplementary may be given too, e.g., H = homopolymer, P = plasticized, E = polymerized in emulsion, Q = mixture of different polymers, etc. (see ISO and DIN codes for data block 1).

Furthermore, ASTM uses * for saran coated polymer films and ** for metallized polymer films. The technical literature indicates biaxially oriented films by BO and oriented films by O (see Abbreviations in alphabetical order).

Code	ISO data block 1	DIN data block 1
A	–	–
B	Block copolymer	–
C	Chlorinated	Chlorinated
D	–	Density
E	Polymerization in emulsion	Expanded or expandable
F	–	Flexible or fluid (liquid state)
G	–	–
H	Homopolymer	High

Code	ISO data block 1	DIN data block 1
I	–	Impact resistant
J	–	–
K	–	–
L	–	Linear or low
M	Bulk polymerization	Medium or molecular
N	–	Normal or novolac
O	–	–
P	Plasticized	Plasticized
Q	Mixtures of different polymers	–
R	Random copolymer	Resol; formerly also: raised (enhanced)
S	Polymerization in suspension	–
T	–	–
U	Unplasticized	Ultra or unplasticized
V	–	Very
W	–	Weight (mass)
X	No indication	Crosslinked or crosslinkable
Y	–	–
Z	–	–

1.2. ISO Codes for Items in Data Block 2 *Data block* 2 may comprise up to four letters which give qualitative information. The first letter denotes the intended application, e.g., B = blow molding, G = general purpose, X = no indication (see example). The following letters 2, 3, and 4 can code up to three essential additives or supplementary information, for example, D = powder (dry blend), F = special burning characteristics (see example), L = light and weather stabilizer, etc.

Code	Position 1	Code	Positions 2–4
A	Adhesives	A	Antioxidant for processing
B	Blow molding	B	Antiblocking agent
C	Calendering	C	Colored
D	Disc manufacture	D	Powder (dry blend)
E	Extrusion (pipes, profiles, sheets)	E	Additive for expansion
F	Extrusion (films, foils)	F	Special burning characteristics
G	General purpose	G	Granules (pellets)
H	Coating	H	Heat aging stabilizer
K	Cable and wire insulation	K	–
L	Extrusion (monofilament)	L	Light and weather stabilizer
M	Injection molding	M	–
N	–	N	Natural (not colored)
P	Paste resin	P	Polymer modifier
Q	Compression molding	Q	–
R	Rotational molding	R	Mold release agent
S	Powder spray sintering	S	Slip agent, lubricant
T	Tape manufacture	T	Improved transparency
W	–	W	Stabilized against hydrolysis
X	No indication	X	–
Y	Textile yarn	Y	–
Z	–	Z	Antistatic agent

1.3. ISO Codes for Items in Data Block 3 *Data block* 3 contains quantitative information about the designated properties. Such properties include

Molar mass indicators	Intrinsic viscosity ("viscosity number")	IV
	Fikentscher's K value (viscosity-based quantity for PVC)	FK
Macrostructure data	Bulk density	BD
Rheological data	Melt flow rate (melt flow index)	MFR
Thermal data	Vicat temperature	VST
	Torsional stiffness temperature	TST
Mechanical properties	Modulus of elasticity	E
	Tensile stress at 100% strain	TS
	Shore hardness	SH
	Impact strength (notched)	ISN

Each material is characterized by one or more than one property. The following leading criteria are used for the various polymers:

Poly(ethylene)	D, MFR
Poly(propylene)	I, MFR
Poly(styrene) and acrylonitrile–styrene copolymer	VST, MFR
Styrene–acrylonitrile copolymer	VST, MFR, AN
Styrene–butadiene copolymer	VST, MFR, ISN
Acrylonitrile–butadiene–styrene, and acrylonitrile–styrene–acrylic acid copolymers	VST, MFR, ISN, AN
Ethylene–vinyl acetate copolymer	VAC, MFR
Poly(vinyl chloride)	IV, (FK), BD
Poly(vinyl chloride), unplasticized	VST, E, ISN
Poly(vinyl chloride), plasticized	TS, SH, TST
Polyamide	IV, E
Polycarbonate	IV, MFR, E
Poly(methyl methacrylate)	IV, VST
Poly(ethylene terephthalate)	IV

In the example for a polyamide 12, the code "22-030" of data block 3 indicates a polymer with an intrinsic viscosity of 210 ml/g ("cell 22"), and a modulus of elasticity of 280 MPa ("cell 030"). On the other hand, "20-D050" in data block 3 for a poly(ethylene) tested according to DIN 16776 means a material with a density within cell "020" (e.g., 0.918 g/cm^3) and a melt flow rate within the cell "050" (e.g., 4.2 g/min), measured under condition D (a temperature of 190°C under a load of 2.16 kg). The definition of cells for each material and testing procedure can be found in special tables.

1.4. ISO Codes for Extending and Reinforcing Fillers (Data Block 4) *Data block* 4 gives information about the type and content of fillers or reinforcing materials. The first

letter gives the type of filler: C = carbon, G = glass, etc. The second letter indicates the shape of the filler: F = fiber, S = spheres, etc. The third position is a code for the weight content of the filler, e.g., "30" for the "cell" (range) 27.5–32.5 wt.%.

Code	Position 1 (material)	Code	Position 2 (form or structure)
B	Boron	B	Balls, beads, spheres
C	Carbon	C	Chips, cuttings
D	–	D	Powder (dry blend)
E	Clay	E	–
F	–	F	Fiber
G	Glass	G	Ground, grinding stock
H	–	H	Whisker
K	Calcium carbonate	K	Knitted fabric
L	Cellulose	L	Layer
M	Mineral, metal	M	Mat (thick)
N	–	N	Non-woven (fabric, thin)
P	Mica	P	Paper
Q	Silicon	Q	–
R	Aramid	R	Roving
S	Synthetic, organic	S	Scale, flake (spheres: now B)
T	Talcum	T	Cord
V	–	V	Veneer
W	Wood	W	Woven fabric
X	Not specified	X	Not specified
Z	Others	Z	Others

1.5. ISO Codes for Data Block 5 *Data block* 5 is reserved for specifications based on individual agreements between supplier and customer. It may code additional requirements, restrictions, or supplemental information.

H. SPI CODES FOR THE RECYCLING OF PLASTICS

Number code	Letter code	Polymer
1	PETE	Poly(ethylene terephthalate)
2	HDPE	High-density poly(ethylene)
3	V	Vinyl chloride polymers
4	LDPE	Low-density poly(ethylene)
5	PP	Poly(propylene)
6	PS	Poly(styrene)
7	–	All other plastics, including multilayered materials

I. RECOMMENDED ABBREVIATIONS AND ACRONYMS FOR NAMES OF ELASTOMERS

Names of elastomers are listed in alphabetical order of the names of their monomers, regardless of their proportions. A "PM" indicates an after-treatment of the polymer; "Other" refers to old or often used "unofficial" abbreviations; # indicates that the abbreviation is recommended by IUPAC.

Monomers (incl. after-treatment of PM)	ASTM	BS	ISO	Other
Acrylic ester + acrylonitrile	ANM			
Acrylic ester + butadiene	ABR#			AR
Acrylester (+ saturated vulcanizable comonomer)	ACM			
Acrylonitrile + butadiene	NBR#			GR-N
–, PM contains carboxylic groups	XNBR			
–, PM is hydrogenated				H-NBR
Acrylonitrile + butadiene + styrene, PM contains COOH groups	XABS			
Butadiene	BR#			BP, CBR
Butadiene + styrene	SBR#	SBR		GR-S
Butadiene + styrene, PM contains COOH groups	XSBR			
Butadiene + styrene, elastomeric triblock copolymers	YSBR			SBS
Butadiene + styrene, elastomeric block copolymers with COOH groups	YXSBR			
Butadiene + 2-vinylpyridine	PBR#			
Butadiene + 2-vinylpyridine + styrene	PSBR			
Chloroprene	CR#	CR		
Chloroprene + acrylonitrile	NCR#			
Chloroprene + styrene	SCR#			
Cyclooctene (*trans* polymer)				TOR
Cyclopentene (*trans* polymer)				TPA, TPR
Epichlorohydrine	CO#		CO	CHR
Epichlorohydrine + ethylene oxide	ECO			CHC
Ethylene (PM postchlorinated)	CM			
Ethylene (PM perchlorosulfonated)	CSM	CSPR		CSR
Ethylene + acrylic ester	EAM			
Ethylene + ethyl acrylate	EEA		E/EA	
Ethylene + propylene	EPM	EPR	EPM	AP
Ethylene + propylene + non-conjugated diene	EPDM	EPTR		APT, EPT
Ethylene + vinyl acetate	EVM			
Ethylene + tetrafluoroethylene				ETFE
Fluorinated carbon chains (substituents: fluoroperfluoroalkyl-, perfluoroalkoxy-)	FKM		FPM	
Hexafluoropropylene + tetrafluoroethylene				FEP
Hexafluoropropylene + vinylidenefluoride	FPM			
Isobutylene	PIB#	PIB	PIB	PIS

Monomers (incl. after-treatment of PM)	ASTM	BS	ISO	Other
Isobutylene + isoprene	IIR#	Butyl		GR-I, PIBI
Isobutylene + isoprene (postbrominated PM)	BIIR			
Isobutylene + isoprene (postchlorinated PM)	CIIR			
Isoprene (natural rubber)	NR#			NK
Isoprene (natural rubber, easy-processing)				SP
Isoprene (natural rubber, standardized Indonesian)				SIR
Isoprene (natural rubber, standardized Malaysian)				SMR
Isoprene (natural rubber, technical classification)				TC
Isoprene (synthetic rubbers)	IR#	IR		CPI, PIP
Isoprene (chlorinated PM)				RUC
Isoprene + acrylonitrile	NIR			
Isoprene + styrene	SIR#			
Isoprene + styrene (triblock copolymer)				SIS
Isoprene + styrene (hydrogenated triblock copolymer)				SEBS
Norbornene				PNR
Phosphonitrile dichloride, with fluorine-containing substituents				PNF
Propylene oxide	PO			OPR
Propylene oxide + allylglycidyl ether	GPO			POR
Silicone with fluoro substituents	FQ			
Silicone with fluoro + methyl substituents	FMQ		MFQ	
Silicone with fluoro + methyl + vinyl substituents	FVMQ			
Silicone with methyl substituents	MQ			
Silicone with phenyl substituents	PQ			
Silicone with phenyl + methyl substituents	PMQ		MPQ	
Silicone with phenyl + vinyl + methyl substituents	PVMQ		MPVQ	
Silicone with vinyl substituents	VQ			
Silicone with vinyl + methyl substituents	VMQ		MVQ	
Sulfides (thioplastics)				T, TR, OT
Tetrafluoroethylene + trifluoronitrosomethane + nitrosoperfluorobutyric acid (nitroso rubber)	AFMU			CNR
Urethane elastomers	UE	UR		
Urethane elastomers with polyester segments	AU		AU	
Urethane elastomers with polyether segments	EU		EU	
Urethane–polyester elastomers, crosslinkable by isocyanates	AU-I			
Urethane–polyester elastomers, crosslinkable by peroxides	AU-P			
Vinylidenefluoride + hexafluoropropylene	FPM		FPM	
Tetrafluoroethylene + perfluoralkylvinyl ether				PFA
Thermoplastic elastomers, in general	TPEL			TPE, TPR
Thermoplastic olefin elastomers				TPE-O, TPO
Thermoplastic elastomers on basis styrene–diene				TPE-S
Thermoplastic elastomers on basis ester				TPE-E
Thermoplastic elastomers on basis ether–amide				TPE-A

The following abbreviations are also used. ICR: rubber from undiluted latex of natural rubber (initial concentration rubber); OER: oil-extended rubber; RTV: room temperature vulcanization.

J. ABBREVIATIONS FOR TEXTILE FIBERS*

	Short Name		Abbreviation

E. List of CAS Regisry Numbers of Common Polymers VIII-32

The advent of computerized database searching for polymer literature has made locating technical information both easier and harder. While computers greatly increase the speed and completeness of a search, the algorithms and conventions used are often quite different from those used for hardcopy (paper) indexes. The following discussion and tables give basic information needed to start identifying and searching the most common polymers in the most used databases and paper indexes.

A. NOMENCLATURE

The *Common Name* is the name used by many scientists and engineers, and is used for listing polymers in catalogs such as Aldrich, and engineering indexes such as Engineering Index. Various other common *Synonyms* or *Trade Names* are also listed in the table and used in the literature. The *Chemical Abstracts (CA) Index Name* is the most recent name used by Chemical Abstracts Service (CAS). In general, Chemical Abstracts follows IUPAC guidelines when naming polymers. The *CAS Registry Number* (CAS Reg. No.) is a unique identifying number given to each of the 18 million chemical compounds CAS has indexed. The *Molecular Formula* is the formula for the smallest repeating unit of the polymer. In some cases, such as cellulose, the exact molecular formula is not known.

B. CAS REGISTRY NUMBERS

CAS Registry Numbers provide a consistent method of identifying and searching for polymers in literature databases, and have been used to develop the table in this section. CAS indexes the chemical and chemical engineering literature from about 80000 worldwide journals, conference papers, books, and patent literature.

The way that CAS (or IUPAC) names a compound is often very different from that used in scientific journals or the popular press. Polyethylene provides an excellent example of this problem. The name in CA is currently Ethene, homopolymer. CAS used to index it under Ethylene, polymers. Over 2000 synonyms or trade names are listed for polyethylene compounds, ranging from Alathon (registered trademark of the Lyondell Petrochemical Company) to Suzulon (a tradename used by Aicello Chemical Corporation, but not trademarked). As CAS understates in its publication, "Polymer Searching", "Unfortunately, naming conventions for polymers have not achieved widespread understanding, and molecular formulas are not unique search terms." CAS Registry Numbers are used not only by CAS in their database indexing but by the US Federal Government in their Toxic Substances Inventory, by the US Department of Transportation for regulating transport of chemicals, and by other indexes such as Merck and Aldrich. They are the most precise and unique compound identification.

Authors of polymer literature may not always be able to report the precise structure of their materials. However, they usually do report the monomers used in the polymerization. Thus, while polymers are represented in two ways, as monomers and by final structure (Structural Repeating Unit or SRU), the primary registration of a polymer is by its component monomers. The Registry Number for most

polymers in the table can be used to find the component Registry Numbers for their corresponding monomers. Similarly, the Registry Number for copolymers will lead to the monomer registry numbers. Searching just by the SRU, the homopolymer, or the copolymer number will not retrieve a complete citation list.

C. INDEXING AND CAS REGISTRY NUMBER ASSIGNMENT

Chemical Abstracts assigns Registry Numbers to polymers based on both their monomers and their final structure. The table here usually lists the Registry Number for the homopolymer or copolymer. However, searches that use only one Registry Number for a polymer are often incomplete. Polymers based on more than one monomer should be searched using all the component monomers. All the copolymer references of a specific monomer can be found by searching the monomer's Registry Number. The polymers having the same final structure can be found by searching the final structure's Registry Number.

Some compounds are so well characterized that they do not follow the rules and are indexed only under their structural repeating unit (SRU). These are marked (R) in the table and include common polymers such as Nylon 6 or PET. Some polymers are not indexed by registry numbers at all but only by subject. These include tung oil, cellulose, and linseed oil, which are marked (S) in the table. These materials are exceptions and, in most searching, registry numbers must be used in the CAS online files. Some registry numbers in the Registry File are marked with an asterisk (*). STN gives the message on-line that these "represent substances of unknown or variable composition, complex reaction products, or biological substances that do not meet the criteria for Chemical Abstracts indexing". These substances generally have been registered for regulatory agencies and receive a CA Index Name. Searching these substances in STN files can be done by using the Registry Number(s) from the record, terms derived from the name, terms that are more or less specific than those in the name (which may include other CAS Registry Numbers), or associated trade names. Every likely term should be tried, and additional help should be sought if other references seem likely.

Section E gives the common names and CA Registry Numbers for a number of important polymers. A list of Registry Numbers in numerical order with their corresponding names is available from the authors. Additional synonyms and trade names are provided, as are the CA Index names. Molecular formulae are provided, and can be helpful in searching with structural-related databases. The Search Guide indices have the following meanings:

S search by CA Index names as a subject in the citation file
* search using every likely term – Registry Numbers, name, synonyms, etc.
R search by Registry Numbers for components, copolymers, SRU's
U search using the single Registry Number provided.

The CAS database system is available commercially, most commonly through STN (1-800-848-6538) and Dialog (1-800-334-2564). Most academic and industrial libraries have ready access to these systems and may be consulted for assistance. For illustrative purposes, searches from each system are demonstrated here. The logic of searching each system is the same, but commands and features can vary. For more information about online searching, consult a librarian or the database vendors. The Chemical Abstracts Service book, "Searching for Polymer Information in CAS Online", American Chemical Society, Chemical Abstracts Service, 1990, p. 173, is the best starting source for polymer information within Chemical Abstracts. It may be ordered by calling the STN toll-free number or using the web page.

D. EXAMPLE SEARCHES

1. Example of a Search Using the Polymer CAS Registry Number

The first step in a CA search is to identify the registry numbers. Section E lists registry numbers for many common polymers. The Registry Number for poly-(acrylamide) is 9003-05-8. Leading zeros should be disregarded when searching online, for example, search 009003-05-8 as 9003-05-8. Using the CA Registry Number to search the chemical compound registry file would return the following information (Fig. 1) from the Dialog database. The Dialog File number at the beginning of each output refers to a specific work session for the user. This particular database provides the molecular formula, related CAS Registry Numbers, the CA name, a list of synonyms including tradenames, the CA Registry Number for the monomer, and the number of literature references over the specified time interval.

2. Example of a Search Using the Monomer CAS Registry Number

The CAS Registry Number for the monomer from the previous example, acrylamide, is 79-06-1. Searching by the component Registry Number in the Registry File gives the following record (Fig. 2).

3. Example of a Combined Search

The results of both searches (polymer and monomer CAS Registry Numbers) would be combined to generate a more complete listing of the literature. The following answers (Fig. 3) are found by searching the abstracts file for CA (399 on Dialog) with the monomer and polymer Registry Numbers.

Searching by the homopolymer Registry Number (RN), 9003-05-8, produced most citations. However, over 6000 additional articles containing information about the monomer would have been missed if the monomer Registry Number, 79-06-1, had not been used. Some of these may contain needed information about the polymer. Only 539 articles were indexed using both Registry Numbers.

(Dialog File 398)
CAS REGISTRY NUMBER: 9003-05-8 (POLYMER)
MOLECULAR FORMULA: (C3H5NO)x
REPLACED CAS REGISTRY NUMBER(S): 9082-06-8 12624-24-7 25038-45-3 27754-57-0 33338-03-3 39355-07-2 39387-77-4 51312-40-4 57679-11-5 68247-81-4 72270-86-1 79079-15-5 104981-89-7 114265-35-9 143180-09-0 143180-13-6 143180-22-7
CA NAME(S):
HP = 2-Propenamide (9CI)
NM = homopolymer

4. Example of a Copolymer Search

Poly(acrylonitrile-*co*-butadiene) is a common commercial product. The STN database was searched for this copolymer, using its CAS Registry Number along with those of the monomers. The search method is similar to that for homopolymers; the copolymer and the two monomers are searched separately, and the results are combined. Some records have been edited for clarity and conciseness. In Fig. 4, component 1 is acrylonitrile and component 2 is butadiene.

```

Figure 4. STN database output from a copolymer search.

Searching by the two component Registry Numbers given above, (107-13-1, acrylonitrile; 106-99-0, butadiene), gives the following records in the Registry File (Fig. 5).

Figure 6 shows the output when all the separate searches (Figs. 4 and 5) are combined. Search strings for each command are shown.

In this case, there are fewer articles for the copolymer (9003-18-3) than for either of the component monomers individually. On the other hand, 550 citations have the two components together, with very little overlap between that set and the copolymer. This once again illustrates the importance of including the monomers to get a complete search in CA files online.

A similar search in the paper version of CA could be done by finding the latest CA name for the homopolymer or copolymer and all related monomers in the Chemical Substance Index, and then referring to the abstracts. The Chemical Substance Index also lists the Registry Numbers for all compounds indexed, and should be checked prior to online work.

Additional search methods include using the trade name, chemical name, and molecular formula in the Registry File to start the search for a polymer Registry Number. The table gives a starting point for common polymers, but with over 700000 polymeric entries, it is impossible to list them all.

5. Example of an Engineering Database Search

Searching the engineering databases is a less formidable task. In most cases, the searches for polymers are started using the common names of the compound. The indexing of the answer set is then evaluated for other terms to use. The following search is from the Engineering Index (file 8) on Dialog (Fig. 7).

```
Set Items Description
... ....... .........
?s polyoxymethylene (compound entered as one word)
  S1   396 POLYOXYMETHYLENE
?s poly()oxymethylene (compound entered as two words)
     39391 POLY

  Identifiers: Polyoxymethylene; Hydroxyphenylbenzotriazole; Polymer
additives
```

Figure 7. Engineering Index output for poly(oxymethylene).

In this case, poly(oxymethylene) is indexed as one word so the search term was appropriate to this database. The two-word search (S2 and S3) was taken from the authors' abstracts, which are searched automatically in this database (unlike in CAS files).

6. Example of a Search with Punctuation in the Polymer Name

Poly(L-proline) is a more difficult search because most databases do not index punctuation. In this case, the compound is entered as if it were three words. In the first search, each word is specified to be in that specific order (adjacent to each other). This search yielded 26 hits (Fig. 8), but the specific records show that the term was found just in the abstract, not in the indexing. Searching by the broader term "polypeptides" would get a larger, less specific, answer set since any polypeptide could be included. The database also shows that "polypeptides" has been an index term since 1977.

Searching poly(L-proline) as three separate words would pull the terms from anywhere in the database record. This method gives more answers than the first search strategy (Fig. 9) but less than the broad polypeptide search.

7. Example of an Engineering Materials Abstracts Search

Similar strategies of searching chemical names and checking indexing should be used for other engineering databases such as Engineering Materials Abstracts. A search of the word, nylon, retrieves a larger answer set than the search of the sequence, nylon 6 (Fig. 10). A check of the indexing determines that nylon 6 is a valid term and would be a more specific, focused search on the topic.

Chemical Abstracts, Engineered Materials, Engineering Index, and other indexes such as Current Contents or the National Technical Information Service are available online through many vendors, on CDROM, at libraries, and over the Internet, via accounts with security and passwords. They are still available in paper copy at many libraries. Before doing any kind of literature search, the researcher must first decide how much information is needed, for what time period, what limits such as language or type of material are to be applied, and how much time is to be devoted to the search. Then each resource can be evaluated for what is covered and how it is indexed so that the proper tools will be used. Finding information is a lot like doing an experiment. Many paths can be explored and different techniques are tried until the researcher is satisfied.

8. Example of a Polymer Trademark Search

A trademark is either a word, phrase, symbol or design, or combination of words, phrases, symbols or designs, which identifies and distinguishes the source of the goods or services of one party from those of others. US trademark rights arise from either (a) actual use of the mark, or (b) the filing of a proper application to register a mark in the Patent

Title: Optical activity measurements in solids 7. Polylactides and poly (
beta -hydroxybutyrates)
  Author: Bartus, Jan; Weng, Dexi; Vogl, Otto
  Corporate Source: Polytechnic Univ, Brooklyn, NY, USA
  Source: Polymer International v 34 n 4 Aug 1994. p 433-442
  Publication Year: 1994
  CODEN: PLYIEI ISSN: 0959-8103
  Language: English
  Document Type: JA; (Journal Article) Treatment: X; (Experimental)
  Journal Announcement: 9412W4
  Abstract: The optical activities of poly-(R)-lactide, poly-(S)-lactide,
poly(beta -hydroxybutyrate) and two beta -hydroxyvalerate copolymers were
measured in solution, as solid powders in suspension, and where possible,
as films. Poly-(plus)-3-methyl-1-pentene was also reinvestigated. In some
cases the specific rotation values of powder samples showed significant
differences from the values of the solution measurements. The discrepancies
of the data observed seem to reflect the local environment of the polymer
chains in supermolecular assemblies and consequently the solid state
structure (morphology) of the polymers. The circular dichroism (CD) spectra
of the polymers were also measured in solution and in the form of their
films. For comparison, the CD spectra of the naturally occurring protein
casein and of the synthetic polypeptide poly-(L)-proline were also
measured. (Author abstract) 21 Refs.

Figure 11. Trademark database search for Alathon.

and Trademark Office (PTO) stating that the applicant has a bonafide intention to use the mark in commerce regulated by the US Congress. Federal registration is not required to establish rights in a mark, nor is it required to begin use of a mark. However, federal registration can secure benefits beyond the rights acquired by merely using a mark. For example, the owner of a federal registration is presumed to be the owner of the mark for the goods and services specified in the registration, and to be entitled to use the mark nationwide. There are two related but distinct types of rights in a mark: the right to register and the right to use. Generally, the first party who either uses a mark in commerce or files an application in the PTO has the ultimate right to register that mark. The PTO's authority is limited to determining the right to register. The right to use a mark can be more complicated to determine.

Information on polymer trademarks can be found by searching in trademark databases on Dialog. The search is complicated because a name may be trademarked in one country, and yet not in another. Trademarks may be sold, or they may be assigned by one business to another.

A search for Alathon, a registered trademark for polyethylene, is given as an example (Fig. 11). Dialog's trademark scan software provides a description of the goods or services the trademark describes, gives the trademark status, the application number, the registration number and type, and the dates of the action. Previous owners or assignees of the trademark can be identified.

Usually, the trademark database of each country of interest must be checked to determine whether the name is registered.

Poly(1,4-butylene succinate-*co* HMDI)	1,4-Butanediol-HMDI-succinic acid copolymer	143606-53-5	Butanedioic acid, polymer with 1,4-butanediol and 1,6-diisocyanatohexane	R	$(C_8H_{12}N_2O_2 \cdot C_4H_{10}O_2 \cdot C_4H_6O_4)_x$
Poly(1,4-butylene terephthalate)	Butanediol–terephthalic acid copolymer; poly(oxytetra-methyleneoxy-terephthalic acid–terephthaloyl); tetramethylene glycol polymer, SRU	24968-12-5	Poly(oxy-1,4-butanediyloxycar-bonyl-1,4-phenylenecarbonyl)	R	$(C_{12}H_{12}O_4)_n$
Poly(caprolactone diol)	Caprolactone – diethylene glycol polymer	36890-68-3	2-Oxepanone, polymer with 2,2′-oxybis(ethanol)	R	$(C_6H_{10}O_2 \cdot C_4H_{10}O_3)_x$
Poly(caprolactone triol)	ε-Caprolactone – trimethylolpropane polymer	37625-56-2	2-Oxepanone, polymer with 2-ethyl-2-(hydroxymethyl)-1,3-propanediol	R	$(C_6H_{14}O_3 \cdot C_6H_{10}O_2)_x$
Poly(caprolactone triol)		54735-63-6	Poly(oxy(1-oxo-1,6-hexanediyl)), α-hydro-ω-hydroxy-, ester with 2-ethyl-2-(hydroxymethyl)-1,3-propanediol (3 : 1)	R	$(C_6H_{10}O_2)_n$ $(C_6H_{10}O_2)_n$ $(C_6H_{10}O_2)_n$ $C_6H_{14}O_3$
Poly(caprolactone)		24980-41-4	2-Oxepanone, homopolymer	R	$(C_6H_{10}O_2)_x$
Poly(chloroprene)	Chlorobutadiene polymer	9010-98-4	1,3-Butadiene, 2-chloro-, homopolymer	R	$(C_4H_5Cl)_x$

Common name	Synonyms	CAS Registry No.	CA name	Search method	Molecular formula
Poly(chlorostyrene)	Chlorostyrene polymer	9022-52-0	Benzene, chloroethenyl-, homopolymer	R	$(C_8H_7Cl)_x$
Poly(4-chlorostyrene)	*p*-Chlorostyrene polymer 4-Chlorostyrene polymer	24991-47-7	Benzene, 1-chloro-4-ethenyl-, homopolymer	R	$(C_8H_7Cl)_x$
Poly(chlorotrifluoroethylene)	Halocarbon oil	9002-83-9	Ethene, chlorotrifluoro-, homopolymer	R	$(C_2ClF_3)_x$
Poly(chlorotrifluoroethylene-*co*-vinylidene fluoride)	Chlorotrifluoroethylene–vinylidene fluoride polymer; trifluorochloroethylene–vinylidene fluoride polymer	9010-75-7	Ethene, chlorotrifluoro-, polymer with 1,1-difluoroethene	R	$(C_2H_2F_2 \cdot C_2ClF_3)_x$
Poly(coumarone-*co*-indene)		35343-70-5	Benzofuran, polymer with 1H-indene	R	$(C_9H_8 \cdot C_8H_6O)_x$
Poly(*o*-cresol glycidyl ether-*co*-formaldehyde)		29690-82-2	Formaldehyde, polymer with (chloromethyl)oxirane and 2-methylphenol	R	$(C_7H_8O \cdot C_3H_5ClO \cdot CH_2O)_x$
Poly(*o*-cresyl glycidyl ether-*co*-formaldehyde)	Cresol–epichlorohydrin–formaldehyde polymer	37382-79-9	Formaldehyde, polymer with (chloromethyl)oxirane and methylphenol	R	$(C_7H_8O \cdot C_3H_5ClO \cdot CH_2O)_x$
Poly(2-cyanobutyl acrylate)	Butyl 2-cyanoacrylate polymer; poly(butyl cyanoacrylate)	25154-80-7	2-Propenoic acid, 2-cyano-, butyl ester, homopolymer	R	$(C_8H_{11}NO_2)_x$
Poly(2-cyanoethyl acrylate)	Poly(ethyl cyanoacrylate);	25067-30-5	2-Propenoic acid, 2-cyano-, ethyl ester, homopolymer	R	$(C_6H_7NO_2)_x$
Poly(2-cyanoheptyl acrylate)		26936-29-8	2-Propenoic acid, 2-cyano-, heptyl ester, homopolymer	R	$(C_{11}H_{17}NO_2)_x$
Poly(2-cyanohexyl acrylate)	Poly(hexyl cyanoacrylate)	26877-39-4	2-Propenoic acid, 2-cyano-, hexyl ester, homopolymer	R	$(C_{10}H_{15}NO_2)_x$
Poly(2-cyanoisobutyl acrylate)	Isobutyl 2-cyanoacrylate polymer	26809-38-1	2-Propenoic acid, 2-cyano-	R	$(C_8H_{11}NO_2)_x$
Poly(2-cyanoisopropyl acrylate)	Poly(isopropyl cyanoacrylate)	25931-02-6	2-Propenoic acid, 2-cyano-, 1-methylethyl ester, homopolymer	R	$(C_7H_9NO_2)_x$
Poly(cyclododecyl acrylate)		56710-66-8	2-Propenoic acid, cyclododecyl ester, homopolymer	R	$(C_{15}H_{26}O_2)_x$
Poly(1,4-cyclohexane dimethylene terephthalate-*co*-ethylene terephthalate)	Dimethyl terephthalate-ethylene glycol-1,4-bis(hydroxymethyl)-cyclohexane copolymer	25640-14-6	1,4-Benzenedicarboxylic acid, dimethyl ester, polymer with 1,4-cyclohexanedimethanol and 2-ethanediol	R	$(C_{10}H_{10}O_4 \cdot C_8H_{16}O_2 \cdot C_2H_6O_2)$
Poly(cyclohexyl methacrylate)		25768-50-7	2-Propenoic acid, 2-methyl-, cyclohexyl ester, homopolymer	R	$(C_{10}H_{16}O_2)_x$
Poly(di(ethylene glycol) glycerol-*alt*-adipic acid)	Diethylene glycol–glycerol–adipic acid copolymer	26760-54-3	Hexanedioic acid, polymer with 2,2′-oxybis(ethanol) and 1,2,3-propanetriol	R	$(C_6H_{10}O_4 \cdot C_4H_{10}O_3 \cdot C_3H_8O_3)$
Poly(diallyl dimethyl ammonium chloride)	Diallyldimethylammonium chloride polymer	26062-79-3	2-Propen-1-aminium, *N,N*-dimethyl-*N*-2-propenyl-, chloride, homopolymer	R	$(C_8H_{16}N \cdot Cl)_x$
Poly(diallyl isophthalate)	Diallyl isophthalate polymer	25035-78-3	1,3-Benzenedicarboxylic acid, di-2-propenyl ester, homopolymer	R	$(C_{14}H_{14}O_4)_x$
Poly(diallyl phthalate)	Diallyl phthalate polymer	25053-15-0	1,2-Benzenedicarboxylic acid, di-2-propenyl ester, homopolymer	R	$(C_{14}H_{14}O_4)_x$
Poly(diaminobenzophenone-*co*-benzophenone tetracarboxylic dianhydride)	Benzophenone tetracarboxylic acid dianhydride-*m,m′*-diaminobenzophenone polymer, SRU	51518-44-6	Poly((1,3-dihydro-1,3-dioxo-2H-isoindole-2,5-diyl)carbonyl-(1,3-dihydro-1,3-dioxo-2H-isoindole-5,2-diyl)-1,3-phenylene-carbonyl-1,3-phenylene)	R	$(C_{30}H_{14}N_2O_6)_n$
Poly((dibenzo-18-crown-6)-*co*-formaldehyde)		53660-42-7	Formaldehyde, polymer with 6,7,9,10,17,18,20,21-octahydro-dibenzo(b,k)(1,4,7,10,13,16) hexaoxacyclooctadecin	R	$(C_{20}H_{24}O_6 \cdot CH_2O)_x$
Poly(dibromostyrene)		62354-98-7	Benzene, dibromoethenyl-, homopolymer	R	$(C_8H_6Br_2)_x$
Poly(dichlorophosphazene)	Dichlorophosphazine polymer; Poly(nitrile(dichlorophosphoranylidyne))	26085-02-9	Poly(nitrilo(dichlorophosphoranylidyne))	R	$(Cl_2NP)_n$

Poly(ethylene-*co*-butyl acrylate-*co*-maleic anhydride)		64652-60-4	2-Propenoic acid, butyl ester, polymer with ethene and 2,5-furandione	R	$(C_7H_{12}O_2 \cdot C_4H_2O_3 \cdot C_2H_4)_x$
Poly(ethylene-*co*-carbon monoxide)	Carbon monoxide–ethylene copolymer	25052-62-4	Ethene, polymer with carbon monoxide	R	$(C_2H_4 \cdot CO)_x$
Poly(ethylene-*co*-ethyl acrylate)	Ethyl acrylate–ethylene polymer	9010-86-0	2-Propenoic acid, ethyl ester, polymer with ethene	R	$(C_5H_8O_2 \cdot C_2H_4)_x$
Poly(ethylene-*co*-ethyl acrylate-*co*-maleic anhydride)		41171-14-6	2-Propenoic acid, ethyl ester, polymer with ethene and 2,5-furandione	R	$(C_5H_8O_2 \cdot C_4H_2O_3 \cdot C_2H_4)_x$
Poly(ethylene-*co*-glycidyl methacrylate)	2,3-Epoxypropyl methacrylate–ethylene copolymer	26061-90-5	2-Propenoic acid, 2-methyl-, oxiranylmethyl ester, polymer with ethene	R	$(C_7H_{10}O_3 \cdot C_2H_4)_x$

Common name	Synonyms	CAS Registry No.	CA name	Search method	Molecular formula
Poly(ethylene-*co*-methacrylic acid)	Ethylene–methacrylic acid copolymers; Poly(ethylene-methacrylic acid)	25053-53-6	2-Propenoic acid, 2-methyl-, polymer with ethene	R	$(C_4H_6O_2 \cdot C_2H_4)_x$
Poly(ethylene-*co*-methacrylic acid), sodium salt	Ethylene–methacrylic acid polymer, sodium salt	25608-26-8	2-Propenoic acid, 2-methyl, polymer with ethene, sodium salt	R	$(C_4H_6O_2 \cdot C_2H_4)_x \cdot xNa$
Poly(ethylene-*co*-methacrylic acid), zinc salt		28516-43-0	2-Propenoic acid, 2-methyl-, polymer with ethene, zinc salt	R	$(C_4H_6O_2 \cdot C_2H_4)_x \cdot xZn$
Poly(ethylene-*co*-methyl acrylate)	Ethylene–methyl acrylate polymer	25103-74-6	2-Propenoic acid, methyl ester, polymer with ethene	R	$(C_4H_6O_2 \cdot C_2H_4)_x$
Poly(ethylene-*co*-methyl acrylate-*co*-acrylic acid)		41525-41-1	2-Propenoic acid, polymer with ethene and methyl 2-propenoate	R	$(C_4H_6O_2 \cdot C_3H_4O_2 \cdot C_2H_4)_x$
Poly(ethylene-*co*-methyl acrylate-*co*-glycidyl methacrylate)		51541-08-3	2-Propenoic acid, 2-methyl-, oxiranylmethyl ester, polymer with ethene and methyl 2-propenoate	R	$(C_7H_{10}O_3 \cdot C_4H_6O_2 \cdot C_2H_4)_x$
Poly(ethylene-*co*-propylene)	Ethylene–propene copolymer; poly(ethylene-propylene); polypro, polypropylene–polyethylene copolymer	9010-79-1	1-Propene, polymer with ethene	R	$(C_3H_6 \cdot C_2H_4)_x$
Poly(ethylene-*co*-propylene-*co*-5-methylene-2-norbornene)	Ethylene–ethylidenebicycloheptene–propene copolymer; ethylene–ethylidenenorbornene–propylene polymer	25038-36-2	Bicyclo(2.2.1)hept-2-ene, 5-ethylidene-, polymer with ethene and 1-propene	R	$(C_9H_{12} \cdot C_3H_6 \cdot C_2H_4)_x$
Poly(ethylene-*co*-tetrafluoroethylene)	Ethylene copolymer with tetrafluoroethylene	25038-71-5	Ethene, tetrafluoro-, polymer with ethene	R	$(C_2H_4 \cdot C_2F_4)_x$
Poly(ethylene-*co*-vinyl acetate)	Vinyl acetate–ethylene polymer	24937-78-8	Acetic acid ethenyl ester, polymer with ethene	R	$(C_4H_6O_2 \cdot C_2H_4)_x$
Poly(ethylene-*co*-vinyl acetate-*co*-carbon monoxide)	Carbon monoxide–ethylene–vinyl acetate polymer	26337-35-9	Acetic acid ethenyl ester, polymer with carbon monoxide and ethene	R	$(C_4H_6O_2 \cdot C_2H_4 \cdot CO)_x$
Poly(ethylene-*graft*-maleic anhydride)		106343-08-2	2,5-Furandione, polymer with ethene, graft	R	$(C_4H_2O_3 \cdot C_2H_4)_x$
Poly(ethylene-*ran*-butylene), mono-ol		68954-09-6	1,3-Butadiene, homopolymer, hydrogenated	*	Unk
Poly(2-ethylhexyl acrylate)	2-Ethylhexyl acrylate polymer	9003-77-4	2-Propenoic acid, 2-ethylhexyl ester, homopolymer	R	$(C_{11}H_{20}O_2)_x$
Poly(2-ethylhexyl methacrylate)		25719-51-1	2-Propenoic acid, 2-methyl-, 2-ethylhexyl ester, homopolymer	R	$(C_{12}H_{22}O_2)_x$
Poly(2-ethyl-2-oxazoline)	2-Ethyl-2-oxazoline polymer; 2-ethyloxazoline homopolymer	25805-17-8	Oxazole, 2-ethyl-4,5-dihydro-, homopolymer	R	$(C_5H_9NO)_x$
Poly(4-ethylstyrene-*co*-divinylbenzene)	Divinylbenzene–ethylstyrene polymer	9043-77-0	Benzene, diethenyl-polymer with ethenylethylbenzene	R	$(C_{10}H_{12} \cdot C_{10}H_{10})_x$
Poly(furfuryl alcohol)		25212-86-6	2-Furanmethanol, homopolymer	R	$(C_5H_6O_2)_x$
Poly(D-glutamic acid), sodium salt		30811-79-1	D-Glutamic acid, homopolymer, sodium salt	R	$(C_5H_9NO_4)_x \cdot xNa$
Poly(L-glutamic acid), sodium salt	Poly(glutamic acid) sodium salt	26247-79-0	L-Glutamic acid, homopolymer, sodium salt	R	$(C_5H_9NO_4)_x \cdot xNa$
Poly(glycine)	Nylon 2, poly(imino(1-oxoethylene))	25718-94-9	Glycine, homopolymer	R	$(C_2H_5NO_2)_x$
Poly(glycolide)	Hydroxyacetic acid polymer; poly(glycolic acid)	26124-68-5	Acetic acid, hydroxy-, homopolymer	R	$(C_2H_4O_3)_x$
Poly(hexadecyl methacrylate)	Poly(cetyl methacrylate)	25986-80-5	2-Propenoic acid, 2-methyl-, hexadecyl ester, homopolymer	R	$(C_{20}H_{38}O_2)_x$
Poly(hexafluoroisopropylidene diphthalic anhydride-*co*-oxydianiline)	Hexafluoroisopropylidenebis-(phthalic anhydride)-oxydianiline copolymer	032240-73-6	1,3-Isobenzofurandione, 5,5′-(2,2,2-trifluoro-1-(trifluoromethyl)-ethylidene)bis-, polymer with 4,4′-oxybis(benzenamine)	R	$(C_{19}H_6F_6O_6 \cdot C_{12}H_{12}N_2O)_x$
Poly(1,6-hexamethylene adipate)	Adipic acid–hexanediol polymer	25212-06-0	Hexanedioic acid, polymer with 1,6-hexanediol	R	$(C_6H_{14}O_2 \cdot C_6H_{10}O_4)_x$
Poly(1,6-hexanediol/neopentyl glycol/di(ethylene glycol)-*alt*-adipic acid) diol		68492-71-7	Hexanedioic acid, polymer with 2,2-dimethyl-1,3-propanediol, 2-ethyl-2-(hydroxymethyl)-1,3-propanediol, 1,6-hexanediol and 2,2′-oxybis(ethanol)	R	$(C_6H_{14}O_3 \cdot C_6H_{14}O_2 \cdot C_6H_{10}O_4 \cdot C_5H_{12}O_2 \cdot C_4H_{10}O_3)_x$

Common name	Synonyms	CAS Registry No.	CA name	Search method	Molecular formula
Poly(1,6-hexanediol/neopentyl glycol-*alt*-adipic acid)	Adipic acid–hexamethylene glycol–neopentyl glycol polymer	25214-14-6	Hexanedioic acid, polymer with 2,2-dimethyl-1,3-propanediol and 1,6-hexanediol	R	$(C_6H_{14}O_2 \cdot C_6H_{10}O_4 \cdot C_5H_{12}O_2)_x$
Poly(hexamethylene diisocyanate)	HMDI homopolymer	28182-81-2	Hexane, 1,6-diisocyanato-, homopolymer	R	$(C_8H_{12}N_2O_2)_x$
Poly(hexyl methacrylate)	Hexyl methacrylate polymer	25087-17-6	2-Propenoic acid, 2-methyl-, hexyl ester, homopolymer	R	$(C_{10}H_{18}O_2)_x$
Poly(1-hexene)		25067-06-5	1-Hexene, homopolymer	R	$(C_6H_{12})_x$
Poly(3-hexyl thiophene), regioregular		140934-50-1	Thiophene, 3-hexyl-, homopolymer	R	$(C_{10}H_{16}S)_x$
Poly(L-histidine)	Polyhistidine	26062-48-6	L-Histidine, homopolymer	R	$(C_6H_7N_3O)_x$
Poly(L-histidine hydrochloride)	Polyhirtidine hydrochloride	61857-39-4	L-Histidine, homopolymer, hydrochloride	R	$(C_6H_9N_3O_2)_x \cdot xClH$
Poly(4-hydroxybenzoate)	Poly(*p*-acetoxybenzoic acid)	26099-71-8	Poly(oxy-1,4-phenylenecarbonyl)	R	$(C_7H_4O_2)_n$
Poly(4-hydroxy benzoic acid-*co*-6-hydroxy-2-naphthoic acid)	*p*-Acetoxybenzoic acid-6-acetoxy-2-naphthoic acid polymer	70679-92-4	2-Naphthalenecarboxylic acid, 6-(acetyloxy)-, polymer with 4-(acetyloxy)benzoic acid	R	$(C_{13}H_{10}O_4 \cdot C_9H_8O_4)_x$
Poly(3-hydroxybutyric acid)	Poly(β-hydroxybutyric acid)	26063-00-3	Butanoic acid, 3-hydroxy-, homopolymer	R	$(C_4H_8O_3)_x$
Poly(3-hydroxybutyric acid-*co*-3-hydroxy valeric acid)	Bipol PHBV; 3-hydroxy butanoic acid-3-hydroxy valeric acid copolymer	80181-31-3	Pentanoic acid, 3-hydroxy-, polymer with 3-hydroxybutanoic acid	R	$(C_5H_{10}O_3 \cdot C_4H_8O_3)_x$
Poly(2-hydroxyethyl methacrylate)	Ethylene glycol monomethacrylate polymer	25249-16-5	2-Propenoic acid, 2-methyl-, 2-hydroxyethyl ester, homopolymer	R	$(C_6H_{10}O_3)_x$
Poly(2-hydroxypropyl methacrylate)		25703-79-1	2-Propenoic acid, 2-methyl, 2-hydroxypropyl ester, homopolymer	R	$(C_7H_{12}O_3)_x$
Poly(imino(tetrachloroterephthaloyl)-iminohexamethylene)	Hexamethylenediamine-perchloroterephthaloyl dichloride copolymer, SRU	071164-49-3	Poly(iminocarbonyl(2,3,5,6-tetrachloro-1,4-phenylene)-carbonylimino-1,6-hexanediyl)	R	$(C_{14}H_{14}Cl_4N_2O_2)_n$
Poly(isobornyl methacrylate)	Methacrylic acid, isobornyl ester, polymers	64114-51-8	2-Propenoic acid, 2-methyl-, 1,7,7-trimethylbicyclo(2.2.1) hept-2-yl ester, exo-, homopolymer	R	$(C_{14}H_{22}O_2)_x$
Poly(isobutyl methacrylate)	Isobutyl methacrylate polymer	9011-15-8	2-Propenoic acid, 2-methyl-, 2-methylpropylester, homopolymer	R	$(C_8H_{14}O_2)_x$
Poly(isobutylene)	Poly(1,1-dimethylethylene); isobutene polymer; isobutylene polymer; polyisobutene	9003-27-4	1-Propene, 2-methyl, homopolymer	R	$(C_4H_8)_x$
Poly(isobutylene-*alt*-maleic anhydride)		26426-80-2	2,5-Furandione, polymer with 2-methyl-1-propene	R	$(C_4H_8 \cdot C_4H_2O_3)_x$
Poly(isobutylene-*co*-isoprene)	Isobutylene–isoprene polymer	9010-85-9	1,3-Butadiene, 2-methyl, polymer with 2-methyl-1-propene	R	$(C_5H_8 \cdot C_4H_8)_x$
Poly(isobutylene-*co*-isoprene)		68081-82-3	1,3-Butadiene, 2-methyl-, polymer with 2-methyl-1-propene, chlorinated	*	$(C_5H_8 \cdot C_4H_8)_x$
Poly(isobutylene-*co*-isoprene), brominated		68441-14-5	1,3-Butadiene, 2-methyl-, polymer with 2-methyl-1-propene, brominated	*	$(C_5H_8 \cdot C_4H_8)_x$
Poly(isodecyl methacrylate)		27300-12-7	2-Propenoic acid, 2-methyl-, isodecyl ester, homopolymer	R	$(C_{14}H_{26}O_2)_x$
Poly(isophorone diisocyanate)		53880-05-0	Cyclohexane, 5-isocyanato-1-(isocyanatomethyl)-1,3,3-trimethyl-, homopolymer	R	$(C_{12}H_{18}N_2O_2)_x$
Poly(isophorone diisocyanate-*co*-poly(propylene glycol))	Isophorone diisocyanate–polypropylene ether glycol polymer; polypropylene glycol–isophorone diisocyanate copolymer	039323-37-0	Poly(oxy(methyl-1,2-ethanediyl)), α-hydro-ω-hydroxy-, polymer with	R	$(C_{12}H_{18}N_2O_2 \cdot (C_3H_6O)_n H_2O)_x$
Poly(isoprene), *cis*	Poly(1-methyl-1-butenylene)	9003-31-0	1,3-Butadiene, 2-methyl-, homopolymer	R	$(C_5H_8)_x$
Poly(isoprene), *trans*		104389-32-4	Poly(1-methyl-1-butene-1,4-diyl), (E)-	R	$(C_5H_8)n$

Common name	Synonyms	CAS Registry No.	CA name	Search method	Molecular formula
Poly(isoprene)-*block*-poly(butadiene)	Butadiene–isoprene polymer; 1,3-Butadiene–isoprene polymer	25102-52-7	1,3-Butadiene, 2-methyl-, polymer with 1,3-butadiene	R	$(C_5H_8 \cdot C_4H_6)_x$
Poly(isoprene-*graft*-maleic acid monomethyl ester)		128000-08-8	1,3-Butadiene, 2-methyl-, homopolymer, maleated, mono-methyl esters	*	Unk
Poly(2-isopropenyl-2-oxazoline-*co*-methyl methacrylate)		27341-60-2	2-Propenoic acid, 2-methyl-, methyl ester, polymer	R	$(C_6H_9NO \cdot C_5H_8O_2)_x$
Poly(isopropyl methacrylate)		26655-94-7	2-Propenoic acid, 2-methyl-, 1-methylethyl ester, homopolymer	R	$(C_7H_{12}O_2)_x$

Poly(vinyl methyl ketone)	Methyl vinyl ketone polymer	25038-87-3	3-Buten-2-one, homopolymer	R	$(C_4H_6O)_x$
Poly(2-vinyl naphthalene)		28406-56-6	Naphthalene, 2-ethenyl-, homopolymer	R	$(C_{12}H_{10})_x$
Poly(vinyl *n*-octodecylcarbamate)		36671-85-9	Carbamic acid, octadecyl-, ethenyl ester, homopolymer	R	$(C_{21}H_{41}NO_2)_x$
Poly(4-vinyl phenol)	*p*-Vinylphenol polymer; *p*-vinylphenol polymer	24979-70-2	Phenol, 4-ethenyl-, homopolymer	R	$(C_8H_8O)_x$
Poly(vinyl propionate)	Vinyl propionate polymer	25035-84-1	Propanoic acid, ethenyl ester, homopolymer	R	$(C_5H_8O_2)_x$
Poly(2-vinyl pyridine)	2-Vinylpyridine polymer	25014-15-7	Pyridine, 2-ethenyl-, homopolymer	R	$(C_7H_7N)_x$
Poly(2-vinyl pyridine-*co*-styrene)	2-Vinylpyridine-styrene polymer	24980-54-9	Pyridine, 2-ethenyl-, polymer with styrene	R	$(C_8H_8 \cdot C_7H_7N)_x$
Poly(vinyl pyrrolidone)	Poly(*n*-pyrrolidinylethylene); poly(vinylpyrrolidone); vinylpyrrolidone polymer	9003-39-8	2-Pyrrolidinone, 1-ethenyl-, homopolymer	R	$(C_6H_9NO)_x$
Poly(vinyl pyrrolidone), iodine complex		25655-41-8	2-Pyrrolidinone, 1-ethenyl-, homopolymer, compd. with iodine	R	$(C_6H_9NO)_x \cdot xI_2$

Common name	Synonyms	CAS Registry No.	CA name	Search method	Molecular formula
Poly(1-vinyl pyrrolidone-*co*-acrylic acid)	Acrylic acid–vinylpyrrolidone polymer	28062-44-4	2-Propenoic acid, polymer with 1-ethenyl-2-pyrrolidinone	R	$(C_6H_9NO \cdot C_3H_4O_2)_x$
Poly(1-vinyl pyrrolidone-*co*-2-dimethylamino-ethyl methacrylate)		30581-59-0	2-Propenoic acid, 2-methyl-, 2-(dimethylamino)ethyl ester, polymer with 1-ethenyl-2-pyrrolidinone	R	$(C_8H_{15}NO_2 \cdot C_6H_9NO)_x$
Poly(1-vinyl pyrrolidone-*co*-styrene)	Styrene-*N*-vinylpyrrolidone polymer; vinylpyrrolidinone–styrene polymer	25086-29-7	2-Pyrrolidinone, 1-ethenyl-, polymer with ethenylbenzene	R	$(C_8H_8 \cdot C_6H_9NO)_x$
Poly(1-vinyl pyrrolidone-*co*-vinyl acetate)	*N*-Vinyl-2-pyrrolidone–vinyl acetate copolymer; poly(vinyl acetate–vinylpyrrolidinone); vinyl acetate–vinylpyrrolidone copolymer	25086-89-9	Acetic acid ethenyl ester, polymer with 1-ethenyl-2-pyrrolidinone	R	$(C_6H_9NO \cdot C_4H_6O_2)_x$
Poly(1-vinyl pyrrolidone-γ-(1-triacontene))		136445-69-7	Alkenes, C > 10 α-, polymers with vinylpyrrolidone	S	Unk
Poly(1-vinyl pyrrolidone-γ-1-hexadecene)		63231-81-2	2-Pyrrolidinone, 1-ethenyl-hexadecyl-, homopolymer	R	$(C_{22}H_{41}NO)_x$
Poly(vinyl stearate)	Vinyl stearate polymer	9003-95-6	Octadecanoic acid, ethenyl ester, homopolymer	R	$(C_{20}H_{38}O_2)_x$
Poly(vinyl sulfate), potassium salt		26182-60-5	Sulfuric acid, monoethenyl ester, potassium salt, homopolymer	R	$(C_2H_4O_4S \cdot K)_x$
Poly(vinyl sulfonic acid), sodium salt	Ethenesulfonic acid polymer sodium salt; ethenesulfonic acid polymer sodium salt	25053-27-4	Ethenesulfonic acid, homopolymer, sodium salt	R	$(C_2H_4O_3S)_x \cdot xNa$
Poly(vinyl toluene)	Poly(methylstyrene); vinyltoluene polymer	9017-21-4	Benzene, ethenylmethyl-homopolymer	R	$(C_9H_{10})x$
Poly(vinyl toluene-*co*-alpha-methylstyrene)	α-Methylstyrene–vinyltoluene polymer	9017-27-0	Benzene, ethenylmethyl-, polymer with (1-methylethenyl)benzene	R	$(C_9H_{10} \cdot C_9H_{10})_x$
Poly(vinylcarbazole); Poly(9-vinyl carbazole)	Poly(*n*-carbazolylethylene); poly(*N*-vinylcarbazole)	25067-59-8	9H-Carbazole, 9-ethenyl-, homopolymer	R	$(C_{14}H_{11}N)_x$
Poly(vinylcyclohexane)		25498-06-0	Cyclohexane, ethenyl-, homopolymer	R	$(C_8H_{14})_x$
Poly(vinylferrocene)		34801-99-5	Ferrocene, ethenyl-, homopolymer	R	$(C_{12}H_{12}Fe)_x$
Poly(vinylidene chloride)	Poly(1,1-dichloroethylene)	9002-85-1	Ethene,1,1-dichloro-, homopolymer	R	$(C_2H_2Cl_2)_x$
Poly(vinylidene chloride-*co*-acrylonitrile)	Acrylonitrile–vinylidene chloride polymer	9010-76-8	2-Propenenitrile, polymer with 1,1-dichloroethene	R	$(C_3H_3N \cdot C_2H_2Cl_2)_x$
Poly(vinylidene chloride-*co*-methyl acrylate)	Methyl acrylate–vinylidene chloride polymer	25038-72-6	2-Propenoic acid, methyl ester, polymer with 1,1-dichloro ethene	R	$(C_4H_6O_2 \cdot C_2H_2Cl_2)_x$
Poly(vinylidene chloride-*co*-vinyl chloride)	Vinyl chloride–vinylidene chloride polymer	9011-06-7	Ethene, 1,1-dichloro-, polymer with chloroethylene	R	$(C_2H_3Cl \cdot C_2H_2Cl_2)_x$
Poly(vinylidene fluoride)	Poly(1,1-difluoroethylene); PVDF	24937-79-9	Ethene, 1,1-difluoro-, homopolymer	R	$(C_2H_2F_2)_x$
Poly(vinylidene fluoride-*co*-hexafluoropropylene)	Hexafluoropropene–vinylidene fluoride polymer	9011-17-0	1-Propene, 1,1,2,3,3,3-hexafluoro-, polymer with 1,1-difluoroethene	R	$(C_3F_6 \cdot C_2H_2F_2)_x$
Poly(vinylidene fluoride-*co*-hexafluoropropylene-*co*-tetrafluoroethylene)	Hexafluoropropene–tetrafluoro-ethylene–vinylidene fluoride polymer; vinylidene fluoride–tetrafluoroethylene–perfluoro-propylene copolymer	25190-89-0	1-Propene, 1,1,2,3,3,3-hexafluoro-, polymer with 1,1-difluoroethene and tetrafluoroethene	R	$(C_3F_6 \cdot C_2H_2F_2 \cdot C_2F_4)_x$
Poly(vinylidene fluoride-*co*-tetrafluoroethylene-*co*-propylene)	Propene–tetrafluoroethylene–vinylidene fluoride copolymer	54675-89-7	1-Propene, polymer with 1,1-difluoroethene and tetrafluoroethene	R	$(C_3H_6 \cdot C_2H_2F_2 \cdot C_2F_4)_x$
Poly(vinylisobutyl ether)	Isobutyl vinyl ether polymer	9003-44-5	Propane, 1-(ethenyloxy)-2-methyl-, homopolymer	R	$(C_6H_{12}O)_x$
Poly(4-vinyl pyridine)	4-Vinylpyridine homopolymer	25232-41-1	Pyridine, 4-ethenyl-, homopolymer	R	$(C_7H_7N)_x$
Poly(4-vinyl pyridine-*co*-butyl methacrylate)	Butyl methacrylate-4-vinylpyridine polymer	53761-76-5	2-Propenoic acid, 2-methyl-, butyl ester, polymer with 4-ethenylpyridine	R	$(C_8H_{14}O_2. C_7H_7N)_x$
Poly(4-vinyl pyridene-*co*-styrene)		26222-40-2	Pyridine, 4-ethenyl-, polymer with ethenylbenzene	R	$(C_8H_8 \cdot C_7H_7N)_x$
Poly(4-vinyl pyridine hydrochloride), crosslinked		29323-87-3	Pyridine, 4-ethenyl-, hydro-chloride, homopolymer	R	$(C_7H_7N \cdot ClH)_x$
Poly(4-vinyl pyridine), crosslinked	Divinylbenzene-4-vinylpyridine polymer	9017-40-7	Pyridine, 4-ethenyl-, polymer with diethenylbenzene	R	$(C_{10}H_{10} \cdot C_7H_7N)_x$

Common name	Synonyms	CAS Registry No.	CA name	Search method	Molecular formula
Poly(4-vinyl pyridinium dichromate)		82246-45-5	Chromic acid ($H_2Cr_2O_7$), salt with diethenylbenzene polymer with 4-ethenylpyridine	R	$(C_{10}H_{10} \cdot C_7H_7N)_x \cdot xCr_2H_2O_7$
Poly(4-vinyl pyridinium tribromide)		91650-35-0	Hydrogen tribromide, compd. with 4-ethenylpyridine (1 : 1), homopolymer	R	$(C_7H_7N \cdot Br_3H)_x$
Poly(*p*-xylylene)		25951-90-0	Benzene, 1,4-dimethyl-, homopolymer	R	$(C_8H_{10})_x$
Rosin, ester with glycerol		8050-31-5	Resin acids and rosin acids, esters with glycerol	S*	Unk
Rosin, ester with pentaerythritol		8050-26-8	Resin acids and rosin acids, esters with pentaerythritol	S*	Unk
Rubber, chlorinated		9006-03-5	Rubber, chlorinated	R	Unk
Safflower seed oil		8001-23-8	Safflower oil	S*	Unk
Silicone oil	Methyl phenyl silicones	63148-58-3	Siloxanes and Silicones, Me Ph	S	Unk
Soybean oil	Fats and glyceridic oils	8001-22-7	Soybean oil	S*	Unk
Starch	Arrowroot starch; potato starch; rice starch; tapioca starch	9005-25-8	Starch	R	Unk
Starch, soluble		9005-84-9	Amylodextrin	R	Unk
Starch-*graft*-poly(acrylic acid), sodium salt	Acrylic acid–starch polymer sodium salt	60323-79-7	Starch, polymer with 2-propenoic acid, sodium salt	R	$(C_3H_4O_2 \cdot \text{Unk})_x \cdot x\text{Na}$
Tri-*o*-benzyl cellulose		91104-69-7	Cellulose, tris(phenylmethyl) ether	R	$(C_7H_8O)_{1/3}$; Unk
Tung oil	Fats and glyceridic oils	8001-20-5	Tung oil	S*	Unk
Zein		9010-66-6	Zeins	S*	Unk

Index

This index lists only physical constants of polymer classes and a few selected specific polymers. Information on specific polymers can be found under the polymer class name. Specific polymers in the index, mostly from Section V, do not necessarily represent the only place of reference of that polymer. Additional references may be found under the respective polymer class name.
